Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336581 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336581 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336581

RNA correlate with, and may be deduced from, the identity of the GAM336581 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336582 6680 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAA detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 336582 (GAM336582) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCACGATTGT GAM336582 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336582 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GTGACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336582 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336582 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336582 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336582 precursor RNA is designated SEQ ID:6680, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6680 is located from position 29073962 to position 29074049 relative to chromosome 16 on the `+` strand.

GAM336582 precursor RNA folds onto itself, forming GAM336582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336582 precursor RNA, designated SEQ ID NO: 6680, and a schematic representation of a predicted secondary folding of GAM336582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336582 folded precursor RNA yielding a GAM336582 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336582 RNA, hereby incorporated herein.

GAM336582 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336582 target RNA, herein designated GAM TARGET RNA.

GAM336582 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336582 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336582 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336582 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336582 RNA, herein designated GAM RNA, to target binding sites on GAM336582 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336582 target RNA into GAM336582 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336582 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336582 target genes. The mRNA of each one of this plurality of GAM336582 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336582 RNA, herein designated GAM RNA, and which when bound by GAM336582 RNA causes inhibition of translation of the GAM336582 target mRNA into a corresponding GAM336582 target protein.

The mechanism of the translational inhibition exerted by GAM336582 RNA, herein designated GAM RNA, on one or more GAM336582 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336582 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336582 RNA, herein designated GAM RNA, of GAM336582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336582 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336582 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336582 RNA correlate with, and may be deduced from, the identity of the GAM336582 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336583 6825 GGGTGTGGTG Fig. 8 further provides a conceptual description of another novel bioinformatically
GAGCACGCCT detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTATCCCAG Messenger 336583 (GAM336583) oligonucleotides modulates expression of respective target
CTACTCAGGA genes whose function and utility is known in the art.

GGCTGAGGTG GAM336583 is a novel bioinformatically detectable regulatory, non protein
GGAGAATCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336583 was detected
CTGAGCCCGG is described with additional reference to Figs. 9-15.

GAGGTAGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGCAGTGAG encoded by the human genome.

TGGAGATCGT GAM336583 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GTCACCACAC GAM336583 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TC GAM336583 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336583 precursor RNA is designated SEQ ID:6825, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6825 is located from position 29086596 to position 29086707 relative to chromosome 17 on the `+` strand.

GAM336583 precursor RNA folds onto itself, forming GAM336583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336583 precursor RNA, designated SEQ ID NO: 6825, and a schematic representation of a predicted secondary folding of GAM336583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336583 folded precursor RNA yielding a GAM336583 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336583 RNA, hereby incorporated herein.

GAM336583 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336583 target RNA, herein designated GAM TARGET RNA.

GAM336583 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336583 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336583 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336583 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336583 RNA, herein designated GAM RNA, to target binding sites on GAM336583 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336583 target RNA into GAM336583 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336583 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336583 target genes. The mRNA of each one of this plurality of GAM336583 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336583 RNA, herein designated GAM RNA, and which when bound by GAM336583 RNA causes inhibition of translation of the GAM336583 target mRNA into a corresponding GAM336583 target protein.

The mechanism of the translational inhibition exerted by GAM336583 RNA, herein designated GAM RNA, on one or more GAM336583 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336583 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336583 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336583 RNA, herein designated GAM RNA, of GAM336583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336583 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336583 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336583 RNA correlate with, and may be deduced from, the identity of the GAM336583 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336584 6928 GTGTGGTGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCACGCCTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TATCCCAGCT Messenger 336584 (GAM336584) oligonucleotides modulates expression of respective target

ACTCAGGAGG genes whose function and utility is known in the art.

CTGAGGTGGG GAM336584 is a novel bioinformatically detectable regulatory, non protein

AGAATCACCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336584 was detected

GAGCCCGGGA is described with additional reference to Figs. 9-15.

GGTAGAGGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCAGTGAGTG encoded by the human genome.

GAGATCGTGT GAM336584 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CACCACAC GAM336584 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336584 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336584 precursor RNA is designated SEQ ID:6928, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6928 is located from position 29086598 to position 29086705 relative to chromosome 17 on the `+` strand.

GAM336584 precursor RNA folds onto itself, forming GAM336584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336584 precursor RNA, designated SEQ ID NO: 6928, and a schematic representation of a predicted secondary folding of GAM336584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336584 folded precursor RNA yielding a GAM336584 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336584 RNA, hereby incorporated herein.

GAM336584 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336584 target RNA, herein designated GAM TARGET RNA.

GAM336584 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336584 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336584 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336584 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336584 RNA, herein designated GAM RNA, to target binding sites on GAM336584 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336584 target RNA into GAM336584 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336584 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336584 target genes. The mRNA of each one of this plurality of GAM336584 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336584 RNA, herein designated GAM RNA, and which when bound by GAM336584 RNA causes inhibition of translation of the GAM336584 target mRNA into a corresponding GAM336584 target protein.

The mechanism of the translational inhibition exerted by GAM336584 RNA, herein designated GAM RNA, on one or more GAM336584 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336584 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336584 RNA, herein designated GAM RNA, of GAM336584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336584 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336584 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336584 RNA correlate with, and may be deduced from, the identity of the GAM336584 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336585 7339 TTGTGGTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTGATTTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGAATGGAGC Messenger 336585 (GAM336585) oligonucleotides modulates expression of respective target

CCCAGACCTT genes whose function and utility is known in the art.

CCTGGTGTTA GAM336585 is a novel bioinformatically detectable regulatory, non protein

CAGCTCTCAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336585 was detected

AGAAGACAAG is described with additional reference to Figs. 9-15.

GACCCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336585 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336585 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336585 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336585 precursor RNA is designated SEQ ID:7339, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:7339 is located from position 29098204 to position 29098280 relative to chromosome 15 on the `+` strand.

GAM336585 precursor RNA folds onto itself, forming GAM336585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336585 precursor RNA, designated SEQ ID NO: 7339, and a schematic representation of a predicted secondary folding of GAM336585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336585 folded precursor RNA yielding a GAM336585 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336585 RNA, hereby incorporated herein.

GAM336585 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336585 target RNA, herein designated GAM TARGET RNA.

GAM336585 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336585 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336585 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336585 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336585 RNA, herein designated GAM RNA, to target binding sites on GAM336585 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336585 target RNA into GAM336585 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336585 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336585 target genes. The mRNA of each one of this plurality of GAM336585 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336585 RNA, herein designated GAM RNA, and which when bound by GAM336585 RNA causes inhibition of translation of the GAM336585 target mRNA into a corresponding GAM336585 target protein.

The mechanism of the translational inhibition exerted by GAM336585 RNA, herein designated GAM RNA, on one or more GAM336585 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336585 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336585 RNA, herein designated GAM RNA, of GAM336585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336585 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336585 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336585 RNA correlate with, and may be deduced from, the identity of the GAM336585 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTGAACCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCGGAGGT Messenger 336586 (GAM336586) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CGAGATTGTG GAM336586 is a novel bioinformatically detectable regulatory, non protein

CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336586 was detected

CCAGCCCGGC is described with additional reference to Figs. 9-15.

AACAGAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACTCC encoded by the human genome.

GAM336586 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336586 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336586 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336586 precursor RNA is designated SEQ ID:6692, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6692 is located from position 29424019 to position 29424104 relative to chromosome 17 on the `+` strand.

GAM336586 precursor RNA folds onto itself, forming GAM336586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336586 precursor RNA, designated SEQ ID NO: 6692, and a schematic representation of a predicted secondary folding of GAM336586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336586 folded precursor RNA yielding a GAM336586 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336586 RNA, hereby incorporated herein.

GAM336586 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336586 target RNA, herein designated GAM TARGET RNA.

GAM336586 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336586 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336586 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336586 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336586 RNA, herein designated GAM RNA, to target binding sites on GAM336586 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336586 target RNA into GAM336586 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336586 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336586 target genes. The mRNA of each one of this plurality of GAM336586 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336586 RNA, herein designated GAM RNA, and which when bound by GAM336586 RNA causes inhibition of translation of the GAM336586 target mRNA into a corresponding GAM336586 target protein.

The mechanism of the translational inhibition exerted by GAM336586 RNA, herein designated GAM RNA, on one or more GAM336586 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336586 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336586 RNA, herein designated GAM RNA, of GAM336586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336586 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336586 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336586 RNA correlate with, and may be deduced from, the identity of the GAM336586 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336587 6717 GGATACATAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGTCACTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

CATTTAAGAT Messenger 336587 (GAM336587) oligonucleotides modulates expression of respective target

GTTTGCATTT genes whose function and utility is known in the art.

CAGCACTTTT GAM336587 is a novel bioinformatically detectable regulatory, non protein

ATAATTCAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336587 was detected

TATGGTGCTG is described with additional reference to Figs. 9-15.

TCCCTTGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTCTTGTTGA encoded by the human genome.

GAGCCACATG GAM336587 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TATCT GAM336587 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336587 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336587 precursor RNA is designated SEQ ID:6717, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6717 is located from position 29435833 to position 29435937 relative to chromosome 7 on the `+` strand.

GAM336587 precursor RNA folds onto itself, forming GAM336587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336587 precursor RNA, designated SEQ ID NO: 6717, and a schematic representation of a predicted secondary folding of GAM336587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336587 folded precursor RNA yielding a GAM336587 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336587 RNA, hereby incorporated herein.

GAM336587 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336587 target RNA, herein designated GAM TARGET RNA.

GAM336587 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336587 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336587 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336587 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336587 RNA, herein designated GAM RNA, to target binding sites on GAM336587 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336587 target RNA into GAM336587 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336587 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336587 target genes. The mRNA of each one of this plurality of GAM336587 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336587 RNA, herein designated GAM RNA, and which when bound by GAM336587 RNA causes inhibition of translation of the GAM336587 target mRNA into a corresponding GAM336587 target protein.

The mechanism of the translational inhibition exerted by GAM336587 RNA, herein designated GAM RNA, on one or more GAM336587 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336587 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336587 RNA, herein designated GAM RNA, of GAM336587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336587 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336587 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336587 RNA correlate with, and may be deduced from, the identity of the GAM336587 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336588 6467 GATACATAGT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGTCACTTCC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATTTAAGATG Messenger 336588 (GAM336588) oligonucleotides modulates expression of respective target
TTTGCATTTC genes whose function and utility is known in the art.

AGCACTTTTA GAM336588 is a novel bioinformatically detectable regulatory, non protein
TAATTCAAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336588 was detected
ATGGTGCTGT is described with additional reference to Figs. 9-15.

CCCTTGAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTTGTTGAG encoded by the human genome.

AGCCACATGT GAM336588 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
ATC GAM336588 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336588 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336588 precursor RNA is designated SEQ ID:6467, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6467 is located from position 29435834 to position 29435936 relative to chromosome 7 on the `+` strand.

GAM336588 precursor RNA folds onto itself, forming GAM336588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336588 precursor RNA, designated SEQ ID NO: 6467, and a schematic representation of a predicted secondary folding of GAM336588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336588 folded precursor RNA yielding a GAM336588 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336588 RNA, hereby incorporated herein.

GAM336588 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336588 target RNA, herein designated GAM TARGET RNA.

GAM336588 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336588 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336588 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336588 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336588 RNA, herein designated GAM RNA, to target binding sites on GAM336588 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336588 target RNA into GAM336588 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336588 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336588 target genes. The mRNA of each one of this plurality of GAM336588 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336588 RNA, herein designated GAM RNA, and which when bound by GAM336588 RNA causes inhibition of translation of the GAM336588 target mRNA into a corresponding GAM336588 target protein.

The mechanism of the translational inhibition exerted by GAM336588 RNA, herein designated GAM RNA, on one or more GAM336588 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336588 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336588 RNA, herein designated GAM RNA, of GAM336588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336588 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336588 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336588 RNA correlate with, and may be deduced from, the identity of the GAM336588 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336589 6817 GGGGGCCACA Fig. 8 further provides a conceptual description of another novel bioinformatically
TTCTCTGGGC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATTCAGAAGC Messenger 336589 (GAM336589) oligonucleotides modulates expression of respective target
CAGGATTTCA genes whose function and utility is known in the art.

TAGGCCATGA GAM336589 is a novel bioinformatically detectable regulatory, non protein
AATCTGCTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336589 was detected
CTTTTAGAAG is described with additional reference to Figs. 9-15.

TGGGCTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336589 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336589 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336589 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336589 precursor RNA is designated SEQ ID:6817, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6817 is located from position 29509893 to position 29509970 relative to chromosome 22 on the `+` strand.

GAM336589 precursor RNA folds onto itself, forming GAM336589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336589 precursor RNA, designated SEQ ID NO: 6817, and a schematic representation of a predicted secondary folding of GAM336589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336589 folded precursor RNA yielding a GAM336589 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336589 RNA, hereby incorporated herein.

GAM336589 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336589 target RNA, herein designated GAM TARGET RNA.

GAM336589 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336589 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336589 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336589 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336589 RNA, herein designated GAM RNA, to target binding sites on GAM336589 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336589 target RNA into GAM336589 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336589 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336589 target genes. The mRNA of each one of this plurality of GAM336589 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336589 RNA, herein designated GAM RNA, and which when bound by GAM336589 RNA causes inhibition of translation of the GAM336589 target mRNA into a corresponding GAM336589 target protein.

The mechanism of the translational inhibition exerted by GAM336589 RNA, herein designated GAM RNA, on one or more GAM336589 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336589 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336589 RNA, herein designated GAM RNA, of GAM336589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336589 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336589 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336589 RNA correlate with, and may be deduced from, the identity of the GAM336589 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336590 6083 CCCTAAAAGT Fig. 8 further provides a conceptual description of another novel bioinformatically
GACTGAATTG detected oligonucleotides of the present invention, referred to here as Genomic Address
CCCAAGTGCT Messenger 336590 (GAM336590) oligonucleotides modulates expression of respective target
TGAACATGGC genes whose function and utility is known in the art.

AGAGGTAGTT GAM336590 is a novel bioinformatically detectable regulatory, non protein
ACTCCTATTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336590 was detected
TGCAGTTTGT is described with additional reference to Figs. 9-15.

GCACTTAAAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATTCCTACAG encoded by the human genome.

TGATTGTTAC GAM336590 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTTACTGGGG GAM336590 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336590 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336590 precursor RNA is designated SEQ ID:6083, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6083 is located from position 29554384 to position 29554493 relative to chromosome 12 on the `-` strand.

GAM336590 precursor RNA folds onto itself, forming GAM336590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336590 precursor RNA, designated SEQ ID NO: 6083, and a schematic representation of a predicted secondary folding of GAM336590 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336590 folded precursor RNA yielding a GAM336590 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336590 RNA, hereby incorporated herein.

GAM336590 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336590 target RNA, herein designated GAM TARGET RNA.

GAM336590 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336590 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336590 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336590 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336590 RNA, herein designated GAM RNA, to target binding sites on GAM336590 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336590 target RNA into GAM336590 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336590 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336590 target genes. The mRNA of each one of this plurality of GAM336590 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336590 RNA, herein designated GAM RNA, and which when bound by GAM336590 RNA causes inhibition of translation of the GAM336590 target mRNA into a corresponding GAM336590 target protein.

The mechanism of the translational inhibition exerted by GAM336590 RNA, herein designated GAM RNA, on one or more GAM336590 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336590 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336590 RNA, herein designated GAM RNA, of GAM336590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336590 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336590 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336590 RNA correlate with, and may be deduced from, the identity of the GAM336590 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAACATGCAG Messenger 336591 (GAM336591) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336591 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336591 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336591 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336591 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336591 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336591 precursor RNA is designated SEQ ID:5853, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5853 is located from position 29889968 to position 29890049 relative to chromosome 18 on the `+` strand.

GAM336591 precursor RNA folds onto itself, forming GAM336591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336591 precursor RNA, designated SEQ ID NO: 5853, and a schematic representation of a predicted secondary folding of GAM336591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336591 folded precursor RNA yielding a GAM336591 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336591 RNA, hereby incorporated herein.

GAM336591 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336591 target RNA, herein designated GAM TARGET RNA.

GAM336591 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336591 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336591 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336591 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336591 RNA, herein designated GAM RNA, to target binding sites on GAM336591 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336591 target RNA into GAM336591 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336591 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336591 target genes. The mRNA of each one of this plurality of GAM336591 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336591 RNA, herein designated GAM RNA, and which when bound by GAM336591 RNA causes inhibition of translation of the GAM336591 target mRNA into a corresponding GAM336591 target protein.

The mechanism of the translational inhibition exerted by GAM336591 RNA, herein designated GAM RNA, on one or more GAM336591 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336591 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336591 RNA, herein designated GAM RNA, of GAM336591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336591 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336591 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336591 RNA correlate with, and may be deduced from, the identity of the GAM336591 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336592 6777 GGGACAAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

AAATGAGAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAAGGCCGT Messenger 336592 (GAM336592) oligonucleotides modulates expression of respective target

AGGGAAGGGC genes whose function and utility is known in the art.

TTCTCTCCTA GAM336592 is a novel bioinformatically detectable regulatory, non protein

CCTCCCACGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336592 was detected

CTTTATCTGT is described with additional reference to Figs. 9-15.

CCAAATCCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCTATTTCCC encoded by the human genome.

GAM336592 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336592 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336592 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336592 precursor RNA is designated SEQ

ID:6777, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6777 is located from position 30010422 to position 30010511 relative to chromosome 22 on the `+` strand.

GAM336592 precursor RNA folds onto itself, forming GAM336592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336592 precursor RNA, designated SEQ ID NO: 6777, and a schematic representation of a predicted secondary folding of GAM336592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336592 folded precursor RNA yielding a GAM336592 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336592 RNA, hereby incorporated herein.

GAM336592 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336592 target RNA, herein designated GAM TARGET RNA.

GAM336592 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336592 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336592 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336592 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336592 RNA, herein designated GAM RNA, to target binding sites on GAM336592 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336592 target RNA into GAM336592 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336592 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336592 target genes. The mRNA of each one of this plurality of GAM336592 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336592 RNA, herein designated GAM RNA, and which when bound by GAM336592 RNA causes inhibition of translation of the GAM336592 target mRNA into a corresponding GAM336592 target protein.

The mechanism of the translational inhibition exerted by GAM336592 RNA, herein designated GAM RNA, on one or more GAM336592 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336592 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336592 RNA, herein designated GAM RNA, of GAM336592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336592 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336592 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336592 RNA correlate with, and may be deduced from, the identity of the GAM336592 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336593 6953 TAAATCTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGAGGGAAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCATGTCCAC Messenger 336593 (GAM336593) oligonucleotides modulates expression of respective target

ACCAGGTGCC genes whose function and utility is known in the art.

CAGACATCTG GAM336593 is a novel bioinformatically detectable regulatory, non protein

GTTGGCTTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336593 was detected

GCTGATTTGT is described with additional reference to Figs. 9-15.

CCTGCAGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCTGCCTTGT encoded by the human genome.

CTGGATTTGC GAM336593 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

ACACTTTCCA GAM336593 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

AGTTGCCCAT GAM336593 precursor RNA does not encode a protein. A nucleotide sequence identical or

TA highly similar to the nucleotide sequence of GAM336593 precursor RNA is designated SEQ ID:6953, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6953 is located from position 30068447 to position 30068568 relative to chromosome 15 on the `+` strand.

GAM336593 precursor RNA folds onto itself, forming GAM336593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336593 precursor RNA, designated SEQ ID NO: 6953, and a schematic representation of a predicted secondary folding of GAM336593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336593 folded precursor RNA yielding a GAM336593 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336593 RNA, hereby incorporated herein.

GAM336593 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336593 target RNA, herein designated GAM TARGET RNA.

GAM336593 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336593 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336593 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336593 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336593 RNA, herein designated GAM RNA, to target binding sites on GAM336593 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336593 target RNA into GAM336593 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336593 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336593 target genes. The mRNA of each one of this plurality of GAM336593 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336593 RNA, herein designated GAM RNA, and which when bound by GAM336593 RNA causes inhibition of translation of the GAM336593 target mRNA into a corresponding GAM336593 target protein.

The mechanism of the translational inhibition exerted by GAM336593 RNA, herein designated GAM RNA, on one or more GAM336593 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336593 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336593 RNA, herein designated GAM RNA, of GAM336593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336593 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336593 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336593 RNA correlate with, and may be deduced from, the identity of the GAM336593 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336594 7238 TGGGCTGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAAAGCATGT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCACACCAGG Messenger 336594 (GAM336594) oligonucleotides modulates expression of respective target

TGCCCAGACA genes whose function and utility is known in the art.

TCTGGTTGGC GAM336594 is a novel bioinformatically detectable regulatory, non protein
TTTGGCTGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336594 was detected
TTGTCCTGCA is described with additional reference to Figs. 9-15.

GGCACCTGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGTCTGGAT encoded by the human genome.

TTGCACACTT GAM336594 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCCAAGTTGC GAM336594 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CCA GAM336594 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336594 precursor RNA is designated SEQ ID:7238, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7238 is located from position 30068453 to position 30068565 relative to chromosome 15 on the `+` strand.

GAM336594 precursor RNA folds onto itself, forming GAM336594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336594 precursor RNA, designated SEQ ID NO: 7238, and a schematic representation of a predicted secondary folding of GAM336594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336594 folded precursor RNA yielding a GAM336594 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336594 RNA, hereby incorporated herein.

GAM336594 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336594 target RNA, herein designated GAM TARGET RNA.

GAM336594 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336594 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336594 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336594 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336594 RNA, herein designated GAM RNA, to target binding sites on GAM336594 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336594 target RNA into GAM336594 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336594 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336594 target genes. The mRNA of each one of this plurality of GAM336594 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336594 RNA, herein designated GAM RNA, and which when bound by GAM336594 RNA causes inhibition of translation of the GAM336594 target mRNA into a corresponding GAM336594 target protein.

The mechanism of the translational inhibition exerted by GAM336594 RNA, herein designated GAM RNA, on one or more GAM336594 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336594 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336594 RNA, herein designated GAM RNA, of GAM336594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336594 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336594 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336594 RNA correlate with, and may be deduced from, the identity of the GAM336594 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336595 6787 GGGAGCTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCAAAACA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAAGATGTCT Messenger 336595 (GAM336595) oligonucleotides modulates expression of respective target

TCTTTTCCCT genes whose function and utility is known in the art.

TAGCCCTTGG GAM336595 is a novel bioinformatically detectable regulatory, non protein

TTTTGTTTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336595 was detected

CAGATGGTGT is described with additional reference to Figs. 9-15.

AGGTGAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AACATTAGTT encoded by the human genome.

GTGGAAGAGG GAM336595 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TATGTATGAC GAM336595 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

TCCC GAM336595 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336595 precursor RNA is designated SEQ ID:6787, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6787 is located from position 30119301 to position 30119414 relative to chromosome 8 on the `+` strand.

GAM336595 precursor RNA folds onto itself, forming GAM336595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336595 precursor RNA, designated SEQ ID NO: 6787, and a schematic representation of a predicted secondary folding of GAM336595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336595 folded precursor RNA yielding a GAM336595 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336595 RNA, hereby incorporated herein.

GAM336595 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336595 target RNA, herein designated GAM TARGET RNA.

GAM336595 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336595 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336595 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336595 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336595 RNA, herein designated GAM RNA, to target binding sites on GAM336595 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336595 target RNA into GAM336595 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336595 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336595 target genes. The mRNA of each one of this plurality of GAM336595 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336595 RNA, herein designated GAM RNA, and which when bound by GAM336595 RNA causes inhibition of translation of the GAM336595 target mRNA into a corresponding GAM336595 target protein.

The mechanism of the translational inhibition exerted by GAM336595 RNA, herein designated GAM RNA, on one or more GAM336595 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336595 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336595 RNA, herein designated GAM RNA, of GAM336595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336595 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336595 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336595 RNA correlate with, and may be deduced from, the identity of the GAM336595 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATGTAATCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGTTGTAAAT encoded by the human genome.

ACCCATCACC GAM336597 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TGCCAGTCAC GAM336597 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CG GAM336597 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336597 precursor RNA is designated SEQ ID:6147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6147 is located from position 30195269 to position 30195380 relative to chromosome 7 on the `-` strand.

GAM336597 precursor RNA folds onto itself, forming GAM336597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336597 precursor RNA, designated SEQ ID NO: 6147, and a schematic representation of a predicted secondary folding of GAM336597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336597 folded precursor RNA yielding a GAM336597 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336597 RNA, hereby incorporated herein.

GAM336597 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336597 target RNA, herein designated GAM TARGET RNA.

GAM336597 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336597 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336597 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336597 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336597 RNA, herein designated GAM RNA, to target binding sites on GAM336597 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336597 target RNA into GAM336597 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336597 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336597 target genes. The mRNA of each one of this plurality of GAM336597 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336597 RNA, herein designated GAM RNA, and which when bound by GAM336597 RNA causes inhibition of translation of the GAM336597 target mRNA into a corresponding GAM336597 target protein.

The mechanism of the translational inhibition exerted by GAM336597 RNA, herein

designated GAM RNA, on one or more GAM336597 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336597 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336597 RNA, herein designated GAM RNA, of GAM336597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336597 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336597 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336597 RNA correlate with, and may be deduced from, the identity of the GAM336597 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336598 5854 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336598 (GAM336598) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336598 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336598 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336598 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336598 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336598 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336598 precursor RNA is designated SEQ ID:5854, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5854 is located from position 30200618 to position 30200699

relative to chromosome 11 on the `+` strand.

GAM336598 precursor RNA folds onto itself, forming GAM336598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336598 precursor RNA, designated SEQ ID NO: 5854, and a schematic representation of a predicted secondary folding of GAM336598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336598 folded precursor RNA yielding a GAM336598 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336598 RNA, hereby incorporated herein.

GAM336598 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336598 target RNA, herein designated GAM TARGET RNA.

GAM336598 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336598 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336598 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336598 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336598 RNA, herein designated GAM RNA, to target binding sites on GAM336598 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336598 target RNA into GAM336598 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336598 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336598 target genes. The mRNA of each one of this plurality of GAM336598 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336598 RNA, herein designated GAM RNA, and which when bound by GAM336598 RNA causes inhibition of translation of the GAM336598 target mRNA into a corresponding GAM336598 target protein.

The mechanism of the translational inhibition exerted by GAM336598 RNA, herein designated GAM RNA, on one or more GAM336598 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336598 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336598 RNA, herein designated GAM RNA, of GAM336598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336598 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336598 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336598 RNA correlate with, and may be deduced from, the identity of the GAM336598 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336599 7150 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGCTTT detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCGGGAG Messenger 336599 (GAM336599) oligonucleotides modulates expression of respective target
GCAGAGGTTG genes whose function and utility is known in the art.

TGGTGAGCCG GAM336599 is a novel bioinformatically detectable regulatory, non protein
AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336599 was detected
ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCGG encoded by the human genome.

AATTCTGTCT GAM336599 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM336599 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336599 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336599 precursor RNA is designated SEQ ID:7150, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7150 is located from position 30643328 to position 30643429 relative to chromosome 16 on the `+` strand.

GAM336599 precursor RNA folds onto itself, forming GAM336599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336599 precursor RNA, designated SEQ ID NO: 7150, and a schematic representation of a predicted secondary folding of GAM336599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336599 folded precursor RNA yielding a GAM336599 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336599 RNA, hereby incorporated herein. Expression of GAM336599 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336599 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336599 target RNA, herein designated GAM TARGET RNA.

GAM336599 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336599 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336599 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336599 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336599 RNA, herein designated GAM RNA, to target binding sites on GAM336599 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336599 target RNA into GAM336599 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336599 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336599 target genes. The mRNA of each one of this plurality of GAM336599 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336599 RNA, herein designated GAM RNA, and which when bound by GAM336599 RNA causes inhibition of translation of the GAM336599 target mRNA into a corresponding GAM336599 target protein.

The mechanism of the translational inhibition exerted by GAM336599 RNA, herein designated GAM RNA, on one or more GAM336599 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336599 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336599 RNA, herein designated GAM RNA, of GAM336599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336599 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336599 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336599 RNA correlate with, and may be deduced from, the identity of the GAM336599 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336600 6404 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTTA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCGGGAGG Messenger 336600 (GAM336600) oligonucleotides modulates expression of respective target

CAGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCCGA GAM336600 is a novel bioinformatically detectable regulatory, non protein
GATCGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336600 was detected
TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGAGCGGA encoded by the human genome.

ATTCTGTCTC GAM336600 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336600 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336600 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336600 precursor RNA is designated SEQ ID:6404, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6404 is located from position 30643329 to position 30643428 relative to chromosome 16 on the `+` strand.

GAM336600 precursor RNA folds onto itself, forming GAM336600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336600 precursor RNA, designated SEQ ID NO: 6404, and a schematic representation of a predicted secondary folding of GAM336600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336600 folded precursor RNA yielding a GAM336600 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336600 RNA, hereby incorporated herein. Expression of GAM336600 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336600 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336600 target RNA, herein designated GAM TARGET RNA.

GAM336600 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336600 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336600 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336600 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336600 RNA, herein designated GAM RNA, to target binding sites on GAM336600 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336600 target RNA into GAM336600 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336600 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336600 target genes. The mRNA of each one of this plurality of GAM336600 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336600 RNA, herein designated GAM RNA, and which when bound by GAM336600 RNA causes inhibition of translation of the GAM336600 target mRNA into a corresponding GAM336600 target protein.

The mechanism of the translational inhibition exerted by GAM336600 RNA, herein designated GAM RNA, on one or more GAM336600 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336600 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336600 RNA, herein designated GAM RNA, of GAM336600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336600 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336600 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336600 RNA correlate with, and may be deduced from, the identity of the GAM336600 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336601 6024 CAGGCAGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTGGAGTAA Messenger 336601 (GAM336601) oligonucleotides modulates expression of respective target
AATGTCAGGT genes whose function and utility is known in the art.

GTTTTTTTTT GAM336601 is a novel bioinformatically detectable regulatory, non protein
TTAAGAAATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336601 was detected
GATTTTTAGT is described with additional reference to Figs. 9-15.

TGTGACGTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTGGCAGGC encoded by the human genome.

TGTCCACGGT GAM336601 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
ATCACTTTCT GAM336601 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GCTTATTTTT GAM336601 precursor RNA does not encode a protein. A nucleotide sequence identical or

AAAAGGTCTG highly similar to the nucleotide sequence of GAM336601 precursor RNA is designated SEQ
ID:6024, and is provided hereinbelow with reference to the sequence listing part.
Nucleotide sequence SEQ ID:6024 is located from position 30673441 to position 30673570 relative to chromosome 13 on the `+` strand.

GAM336601 precursor RNA folds onto itself, forming GAM336601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336601 precursor RNA, designated SEQ ID NO: 6024, and a schematic representation of a predicted secondary folding of GAM336601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336601 folded precursor RNA yielding a GAM336601 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336601 RNA, hereby incorporated herein.

GAM336601 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336601 target RNA, herein designated GAM TARGET RNA.

GAM336601 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336601 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336601 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336601 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336601 RNA, herein designated GAM RNA, to target binding sites on GAM336601 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336601 target RNA into GAM336601 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336601 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336601 target genes. The mRNA of each one of this plurality of GAM336601 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336601 RNA, herein designated GAM RNA, and which when bound by GAM336601 RNA causes inhibition of translation of the GAM336601 target mRNA into a corresponding GAM336601 target protein.

The mechanism of the translational inhibition exerted by GAM336601 RNA, herein designated GAM RNA, on one or more GAM336601 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336601 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336601 RNA, herein designated GAM RNA, of GAM336601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336601 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336601 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336601 RNA correlate with, and may be deduced from, the identity of the GAM336601 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACTCTGCCTC GAM336602 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM336602 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336602 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336602 precursor RNA is designated SEQ ID:7171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7171 is located from position 30748368 to position 30748468 relative to chromosome 10 on the `+` strand.

GAM336602 precursor RNA folds onto itself, forming GAM336602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336602 precursor RNA, designated SEQ ID NO: 7171, and a schematic representation of a predicted secondary folding of GAM336602 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336602 folded precursor RNA yielding a GAM336602 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336602 RNA, hereby incorporated herein. Expression of GAM336602 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336602 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336602 target RNA, herein designated GAM TARGET RNA.

GAM336602 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336602 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336602 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336602 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336602 RNA, herein designated GAM RNA, to target binding sites on GAM336602 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336602 target RNA into GAM336602 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336602 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336602 target genes. The mRNA of each one of this plurality of GAM336602 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336602 RNA, herein designated GAM RNA, and which when bound by GAM336602 RNA causes inhibition of translation of the GAM336602 target mRNA into a corresponding GAM336602 target protein.

The mechanism of the translational inhibition exerted by GAM336602 RNA, herein designated GAM RNA, on one or more GAM336602 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336602 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336602 RNA, herein designated GAM RNA, of GAM336602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336602 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336602 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336602 RNA correlate with, and may be deduced from, the identity of the GAM336602 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336605 7202 TGCTAAAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAGGGGCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTTGTCAGA Messenger 336605 (GAM336605) oligonucleotides modulates expression of respective target

CTATTTTGTC genes whose function and utility is known in the art.

TATAACTAGG GAM336605 is a novel bioinformatically detectable regulatory, non protein

GTAGCCATAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336605 was detected

ATGCCAATTT is described with additional reference to Figs. 9-15.

CCCCAAGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTCTTGATTA encoded by the human genome.

GCTTCTATTT GAM336605 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTTGGCA GAM336605 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336605 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336605 precursor RNA is designated SEQ ID:7202, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7202 is located from position 31058191 to position 31058297 relative to chromosome 8 on the `+` strand.

GAM336605 precursor RNA folds onto itself, forming GAM336605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336605 precursor RNA, designated SEQ ID NO: 7202, and a schematic representation of a predicted secondary folding of GAM336605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336605 folded precursor RNA yielding a GAM336605 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336605 RNA, hereby incorporated herein.

GAM336605 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336605 target RNA, herein designated GAM TARGET RNA.

GAM336605 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336605 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336605 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336605 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336605 RNA, herein designated GAM RNA, to target binding sites on GAM336605 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336605 target RNA into GAM336605 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336605 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336605 target genes. The mRNA of each one of this plurality of GAM336605 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM336605 RNA, herein designated GAM RNA, and which when bound by GAM336605 RNA causes inhibition of translation of the GAM336605 target mRNA into a corresponding GAM336605 target protein.

The mechanism of the translational inhibition exerted by GAM336605 RNA, herein designated GAM RNA, on one or more GAM336605 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336605 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336605 RNA, herein designated GAM RNA, of GAM336605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336605 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336605 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336605 RNA correlate with, and may be deduced from, the identity of the GAM336605 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336606 6732 GGCAGGAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCACTTGAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAGGAGGCA Messenger 336606 (GAM336606) oligonucleotides modulates expression of respective target

GAGGTTGCAG genes whose function and utility is known in the art.

TGAGCCAAGA GAM336606 is a novel bioinformatically detectable regulatory, non protein

TCATGCCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336606 was detected

GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAATGAAAC encoded by the human genome.

TCTGTC GAM336606 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336606 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336606 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336606 precursor RNA is designated SEQ ID:6732, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6732 is located from position 31418591 to position 31418686 relative to chromosome 1 on the `+` strand.

GAM336606 precursor RNA folds onto itself, forming GAM336606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336606 precursor RNA, designated SEQ ID NO: 6732, and a schematic representation of a predicted secondary folding of GAM336606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336606 folded precursor RNA yielding a GAM336606 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336606 RNA, hereby incorporated herein. Expression of GAM336606 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336606 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336606 target RNA, herein designated GAM TARGET RNA.

GAM336606 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336606 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336606 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336606 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336606 RNA, herein designated GAM RNA, to target binding sites on GAM336606 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336606 target RNA into GAM336606 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336606 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336606 target genes. The mRNA of each one of this plurality of GAM336606 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336606 RNA, herein designated GAM RNA, and which when bound by GAM336606 RNA causes inhibition of translation of the GAM336606 target mRNA into a corresponding GAM336606 target protein.

The mechanism of the translational inhibition exerted by GAM336606 RNA, herein designated GAM RNA, on one or more GAM336606 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336606 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336606 RNA, herein designated GAM RNA, of GAM336606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336606 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336606 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336606 RNA correlate with, and may be deduced from, the identity of the GAM336606 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336607 7155 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATGGCGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 336607 (GAM336607) oligonucleotides modulates expression of respective target

GCAGAGCTTG genes whose function and utility is known in the art.

CAGTGAGCCC GAM336607 is a novel bioinformatically detectable regulatory, non protein

AGATTGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336607 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGCGAG encoded by the human genome.

ACTCCGTCTC GAM336607 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336607 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336607 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336607 precursor RNA is designated SEQ ID:7155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7155 is located from position 31554609 to position 31554709 relative to chromosome 6 on the `+` strand.

GAM336607 precursor RNA folds onto itself, forming GAM336607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336607 precursor RNA, designated SEQ ID NO: 7155, and a schematic representation of a predicted secondary folding of GAM336607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336607 folded precursor RNA yielding a GAM336607 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336607 RNA, hereby incorporated herein. Expression of GAM336607 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336607 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336607 target RNA, herein designated GAM TARGET RNA.

GAM336607 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336607 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336607 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336607 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336607 RNA, herein designated GAM RNA, to target binding sites on GAM336607 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336607 target RNA into GAM336607 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336607 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336607 target genes. The mRNA of each one of this plurality of GAM336607 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336607 RNA, herein designated GAM RNA, and which when bound by GAM336607 RNA causes inhibition of translation of the GAM336607 target mRNA into a corresponding GAM336607 target protein.

The mechanism of the translational inhibition exerted by GAM336607 RNA, herein designated GAM RNA, on one or more GAM336607 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336607 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336607 RNA, herein designated GAM RNA, of GAM336607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336607 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336607 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336607 RNA correlate with, and may be deduced from, the identity of the GAM336607 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGCGAGA encoded by the human genome.

CTCCGTCTC GAM336608 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336608 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336608 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336608 precursor RNA is designated SEQ ID:6411, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6411 is located from position 31554610 to position 31554708 relative to chromosome 6 on the `+` strand.

GAM336608 precursor RNA folds onto itself, forming GAM336608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336608 precursor RNA, designated SEQ ID NO: 6411, and a schematic representation of a predicted secondary folding of GAM336608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336608 folded precursor RNA yielding a GAM336608 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336608 RNA, hereby incorporated herein. Expression of GAM336608 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336608 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336608 target RNA, herein designated GAM TARGET RNA.

GAM336608 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336608 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336608 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336608 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336608 RNA, herein designated GAM RNA, to target binding sites on GAM336608 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336608 target RNA into GAM336608 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336608 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336608 target genes. The mRNA of each one of this plurality of GAM336608 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336608 RNA, herein designated GAM RNA, and which when bound by GAM336608 RNA causes inhibition of translation of the GAM336608 target mRNA into a corresponding GAM336608 target protein.

The mechanism of the translational inhibition exerted by GAM336608 RNA, herein designated GAM RNA, on one or more GAM336608 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336608 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336608 RNA, herein designated GAM RNA, of GAM336608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336608 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336608 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336608 RNA correlate with, and may be deduced from, the identity of the GAM336608 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTAATGTGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCAGGGCGCG encoded by the human genome.

GTC GAM336609 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336609 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336609 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336609 precursor RNA is designated SEQ ID:6469, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6469 is located from position 31572572 to position 31572664 relative to chromosome 10 on the `-` strand.

GAM336609 precursor RNA folds onto itself, forming GAM336609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336609 precursor RNA, designated SEQ ID NO: 6469, and a schematic representation of a predicted secondary folding of GAM336609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336609 folded precursor RNA yielding a GAM336609 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336609 RNA, hereby incorporated herein.

GAM336609 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336609 target RNA, herein designated GAM TARGET RNA.

GAM336609 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336609 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336609 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336609 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336609 RNA, herein designated GAM RNA, to target binding sites on GAM336609 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336609 target RNA into GAM336609 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336609 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336609 target genes. The mRNA of each one of this plurality of GAM336609 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336609 RNA, herein designated GAM RNA, and which when bound by GAM336609 RNA causes inhibition of translation of the GAM336609 target mRNA into a corresponding GAM336609 target protein.

The mechanism of the translational inhibition exerted by GAM336609 RNA, herein designated GAM RNA, on one or more GAM336609 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336609 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336609 RNA, herein designated GAM RNA, of GAM336609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336609 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336609 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336609 RNA correlate with, and may be deduced from, the identity of the GAM336609 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336610 (GAM336610) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336610 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336610 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336610 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336610 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336610 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336610 precursor RNA is designated SEQ ID:6205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6205 is located from position 31820024 to position 31820126 relative to chromosome 6 on the `+` strand.

GAM336610 precursor RNA folds onto itself, forming GAM336610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336610 precursor RNA, designated SEQ ID NO: 6205, and a schematic representation of a predicted secondary folding of GAM336610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336610 folded precursor RNA yielding a GAM336610 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336610 RNA, hereby incorporated herein. Expression of GAM336610 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336610 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336610 target RNA, herein designated GAM TARGET RNA.

GAM336610 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336610 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336610 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336610 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336610 RNA, herein designated GAM RNA, to target binding sites on GAM336610 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336610 target RNA into GAM336610 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336610 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336610 target genes. The mRNA of each one of this plurality of GAM336610 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336610 RNA, herein designated GAM RNA, and which when bound by GAM336610 RNA causes inhibition of translation of the GAM336610 target mRNA into a corresponding GAM336610 target protein.

The mechanism of the translational inhibition exerted by GAM336610 RNA, herein designated GAM RNA, on one or more GAM336610 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336610 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336610 RNA, herein designated GAM RNA, of GAM336610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336610 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336610 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336610 RNA correlate with, and may be deduced from, the identity of the GAM336610 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336611 6838 GGTCGTTTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTTCAGTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCAGGTTCTT Messenger 336611 (GAM336611) oligonucleotides modulates expression of respective target

CATACACATG genes whose function and utility is known in the art.

GATGTCTCAC GAM336611 is a novel bioinformatically detectable regulatory, non protein

AGATCAGCTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336611 was detected

AGGCCTGTGT is described with additional reference to Figs. 9-15.

TTGAACACCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTCACCCC encoded by the human genome.

TGCAAGGAGC GAM336611 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM336611 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336611 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336611 precursor RNA is designated SEQ ID:6838, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6838 is located from position 32058440 to position 32058540 relative to chromosome 18 on the `+` strand.

GAM336611 precursor RNA folds onto itself, forming GAM336611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336611 precursor RNA, designated SEQ ID NO: 6838, and a schematic representation of a predicted secondary folding of GAM336611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336611 folded precursor RNA yielding a GAM336611 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336611 RNA, hereby incorporated herein.

GAM336611 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336611 target RNA, herein designated GAM TARGET RNA.

GAM336611 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336611 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336611 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336611 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336611 RNA, herein designated GAM RNA, to target binding sites on GAM336611 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336611 target RNA into GAM336611 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336611 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336611 target genes. The mRNA of each one of this plurality of GAM336611 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336611 RNA, herein designated GAM RNA, and which when bound by GAM336611 RNA causes inhibition of translation of the GAM336611 target mRNA into a corresponding GAM336611 target protein.

The mechanism of the translational inhibition exerted by GAM336611 RNA, herein designated GAM RNA, on one or more GAM336611 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336611 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336611 RNA, herein designated GAM RNA, of GAM336611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336611 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336611 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336611 RNA correlate with, and may be deduced from, the identity of the GAM336611 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336614 5855 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336614 (GAM336614) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336614 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336614 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336614 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336614 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336614 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336614 precursor RNA is designated SEQ ID:5855, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5855 is located from position 32152882 to position 32152963 relative to chromosome 10 on the `+` strand.

GAM336614 precursor RNA folds onto itself, forming GAM336614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336614 precursor RNA, designated SEQ ID NO: 5855, and a schematic representation of a predicted secondary folding of GAM336614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336614 folded precursor RNA yielding a GAM336614 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336614 RNA, hereby incorporated herein.

GAM336614 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336614 target RNA, herein designated GAM TARGET RNA.

GAM336614 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336614 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336614 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336614 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336614 RNA, herein designated GAM RNA, to target binding sites on GAM336614 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336614 target RNA into GAM336614 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336614 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336614 target genes. The mRNA of each one of this plurality of GAM336614 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336614 RNA, herein designated GAM RNA, and which when bound by GAM336614 RNA causes inhibition of translation of the GAM336614 target mRNA into a corresponding GAM336614 target protein.

The mechanism of the translational inhibition exerted by GAM336614 RNA, herein designated GAM RNA, on one or more GAM336614 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336614 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336614 RNA, herein designated GAM RNA, of GAM336614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336614 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336614 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336614 RNA correlate with, and may be deduced from, the identity of the GAM336614 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336617 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336617 precursor RNA is designated SEQ ID:6347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6347 is located from position 32403384 to position 32403481 relative to chromosome 9 on the `+` strand.

GAM336617 precursor RNA folds onto itself, forming GAM336617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336617 precursor RNA, designated SEQ ID NO: 6347, and a schematic representation of a predicted secondary folding of GAM336617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336617 folded precursor RNA yielding a GAM336617 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336617 RNA, hereby incorporated herein.

GAM336617 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336617 target RNA, herein designated GAM TARGET RNA.

GAM336617 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336617 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336617 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336617 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336617 RNA, herein designated GAM RNA, to target binding sites on GAM336617 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336617 target RNA into GAM336617 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336617 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336617 target genes. The mRNA of each one of this plurality of GAM336617 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336617 RNA, herein designated GAM RNA, and which when bound by GAM336617 RNA causes inhibition of translation of the GAM336617 target mRNA into a corresponding GAM336617 target protein.

The mechanism of the translational inhibition exerted by GAM336617 RNA, herein designated GAM RNA, on one or more GAM336617 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336617 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336617 RNA, herein designated GAM RNA, of GAM336617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336617 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336617 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336617 RNA correlate with, and may be deduced from, the identity of the GAM336617 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336618 (GAM336618) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336618 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336618 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336618 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336618 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336618 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336618 precursor RNA is designated SEQ ID:6235, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6235 is located from position 32615342 to position 32615449 relative to chromosome 21 on the `+` strand.

GAM336618 precursor RNA folds onto itself, forming GAM336618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336618 precursor RNA, designated SEQ ID NO: 6235, and a schematic representation of a predicted secondary folding of GAM336618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336618 folded precursor RNA yielding a GAM336618 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336618 RNA, hereby incorporated herein.

GAM336618 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336618 target RNA, herein designated GAM TARGET RNA.

GAM336618 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336618 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336618 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336618 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336618 RNA, herein designated GAM RNA, to target binding sites on GAM336618 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336618 target RNA into GAM336618 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336618 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336618 target genes. The mRNA of each one of this plurality of GAM336618 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336618 RNA, herein designated GAM RNA, and which when bound by GAM336618 RNA causes inhibition of translation of the GAM336618 target mRNA into a corresponding GAM336618 target protein.

The mechanism of the translational inhibition exerted by GAM336618 RNA, herein designated GAM RNA, on one or more GAM336618 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336618 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336618 RNA, herein designated GAM RNA, of

GAM336618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336618 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336618 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336618 RNA correlate with, and may be deduced from, the identity of the GAM336618 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336619 6956 TAAGAGGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCATTCTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TATCAGACAT Messenger 336619 (GAM336619) oligonucleotides modulates expression of respective target

AAATCCCCTC genes whose function and utility is known in the art.

CCAGGAACTT GAM336619 is a novel bioinformatically detectable regulatory, non protein

TTGTGTCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336619 was detected

ACCCAGAGGA is described with additional reference to Figs. 9-15.

CTGGCTCTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336619 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336619 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336619 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336619 precursor RNA is designated SEQ ID:6956, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6956 is located from position 32615357 to position 32615436 relative to chromosome 21 on the `+` strand.

GAM336619 precursor RNA folds onto itself, forming GAM336619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336619 precursor RNA, designated SEQ ID NO: 6956, and

a schematic representation of a predicted secondary folding of GAM336619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336619 folded precursor RNA yielding a GAM336619 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336619 RNA, hereby incorporated herein.

GAM336619 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336619 target RNA, herein designated GAM TARGET RNA.

GAM336619 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336619 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336619 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336619 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336619 RNA, herein designated GAM RNA, to target binding sites on GAM336619 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336619 target RNA into GAM336619 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336619 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336619 target genes. The mRNA of each one of this plurality of GAM336619 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336619 RNA, herein designated GAM RNA, and which when bound by GAM336619 RNA causes inhibition of translation of the GAM336619 target mRNA into a corresponding GAM336619 target protein.

The mechanism of the translational inhibition exerted by GAM336619 RNA, herein designated GAM RNA, on one or more GAM336619 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336619 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336619 RNA, herein designated GAM RNA, of GAM336619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336619 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336619 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336619 RNA correlate with, and may be deduced from, the identity of the GAM336619 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336620 5662 AAGAGGCAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CATTCTGGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATCAGACATA Messenger 336620 (GAM336620) oligonucleotides modulates expression of respective target

AATCCCCTCC genes whose function and utility is known in the art.

CAGGAACTTT GAM336620 is a novel bioinformatically detectable regulatory, non protein

TGTGTCCTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336620 was detected

CCCAGAGGAC is described with additional reference to Figs. 9-15.

TGGCTCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336620 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336620 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336620 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336620 precursor RNA is designated SEQ ID:5662, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5662 is located from position 32615358 to position 32615435 relative to chromosome 21 on the `+` strand.

GAM336620 precursor RNA folds onto itself, forming GAM336620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336620 precursor RNA, designated SEQ ID NO: 5662, and a schematic representation of a predicted secondary folding of GAM336620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336620 folded precursor RNA yielding a GAM336620 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336620 RNA, hereby incorporated herein.

GAM336620 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336620 target RNA, herein designated GAM TARGET RNA.

GAM336620 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336620 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336620 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336620 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336620 RNA, herein designated GAM RNA, to target binding sites on GAM336620 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336620 target RNA into GAM336620 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336620 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336620 target genes. The mRNA of each one of this plurality of GAM336620 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336620 RNA, herein designated GAM RNA, and which when bound by GAM336620 RNA causes inhibition of translation of the GAM336620 target mRNA into a corresponding GAM336620 target protein.

The mechanism of the translational inhibition exerted by GAM336620 RNA, herein designated GAM RNA, on one or more GAM336620 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336620 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336620 RNA, herein designated GAM RNA, of GAM336620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336620 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336620 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336620 RNA correlate with, and may be deduced from, the identity of the GAM336620 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CATGGTGGC GAM336622 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336622 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336622 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336622 precursor RNA is designated SEQ ID:6544, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6544 is located from position 32800023 to position 32800121 relative to chromosome 12 on the `-` strand.

GAM336622 precursor RNA folds onto itself, forming GAM336622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336622 precursor RNA, designated SEQ ID NO: 6544, and a schematic representation of a predicted secondary folding of GAM336622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336622 folded precursor RNA yielding a GAM336622 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336622 RNA, hereby incorporated herein.

GAM336622 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336622 target RNA, herein designated GAM TARGET RNA.

GAM336622 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336622 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336622 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336622 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336622 RNA, herein designated GAM RNA, to target binding sites on GAM336622 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336622 target RNA into GAM336622 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336622 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336622 target genes. The mRNA of each one of this plurality of GAM336622 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336622 RNA, herein designated GAM RNA, and which when bound by GAM336622 RNA causes inhibition of translation of the GAM336622 target mRNA into a corresponding GAM336622 target protein.

The mechanism of the translational inhibition exerted by GAM336622 RNA, herein designated GAM RNA, on one or more GAM336622 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336622 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336622 RNA, herein designated GAM RNA, of GAM336622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336622 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336622 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336622 RNA correlate with, and may be deduced from, the identity of the GAM336622 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336626 5856 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336626 (GAM336626) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA TGTGCCATGT TGGTGTGCTG CACCCATTAA CT

GAM336626 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336626 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336626 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336626 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336626 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336626 precursor RNA is designated SEQ ID:5856, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5856 is located from position 33075772 to position 33075853 relative to chromosome 3 on the `+` strand.

GAM336626 precursor RNA folds onto itself, forming GAM336626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336626 precursor RNA, designated SEQ ID NO: 5856, and a schematic representation of a predicted secondary folding of GAM336626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336626 folded precursor RNA yielding a GAM336626 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336626 RNA, hereby incorporated herein.

GAM336626 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336626 target RNA, herein designated GAM TARGET RNA.

GAM336626 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336626 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336626 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336626 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336626 RNA, herein designated GAM RNA, to target binding sites on GAM336626 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336626 target RNA into GAM336626 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336626 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336626 target genes. The mRNA of each one of this plurality of GAM336626 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336626 RNA, herein designated GAM RNA, and which when bound by GAM336626 RNA causes inhibition of translation of the GAM336626 target mRNA into a corresponding GAM336626 target protein.

The mechanism of the translational inhibition exerted by GAM336626 RNA, herein designated GAM RNA, on one or more GAM336626 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336626 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336626 RNA, herein designated GAM RNA, of GAM336626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336626 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336626 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336626 RNA correlate with, and may be deduced from, the identity of the GAM336626 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336628 5734 AGAGTCACCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCCTTCCCC GAM336628 is a novel bioinformatically detectable regulatory, non protein
TTCAATAAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336628 was detected
CTGGGATTGG is described with additional reference to Figs. 9-15.

GCCCAGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CTGTGTTTTT encoded by the human genome.

TAAGCACCCA GAM336628 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GGTTATTCT GAM336628 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336628 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336628 precursor RNA is designated SEQ ID:5734, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5734 is located from position 33138955 to position 33139063 relative to chromosome 17 on the `+` strand.

GAM336628 precursor RNA folds onto itself, forming GAM336628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336628 precursor RNA, designated SEQ ID NO: 5734, and a schematic representation of a predicted secondary folding of GAM336628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336628 folded precursor RNA yielding a GAM336628 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336628 RNA, hereby incorporated herein.

GAM336628 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336628 target RNA, herein designated GAM TARGET RNA.

GAM336628 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336628 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336628 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336628 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336628 RNA, herein designated GAM RNA, to target binding sites on GAM336628 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336628 target RNA into GAM336628 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336628 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336628 target genes. The mRNA of each one of this plurality of GAM336628 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336628 RNA, herein designated GAM RNA, and which when bound by GAM336628 RNA causes inhibition of translation of the GAM336628 target mRNA into a corresponding GAM336628 target protein.

The mechanism of the translational inhibition exerted by GAM336628 RNA, herein designated GAM RNA, on one or more GAM336628 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336628 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336628 RNA, herein designated GAM RNA, of GAM336628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336628 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336628 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336628 RNA correlate with, and may be deduced from, the identity of the GAM336628 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336629 6501 GCATTAAAAT AATTAAAGTG TCTGAGGCCT TCCCCTTCAA TAAATCTGGG ATTGGGCCCA GGCAACTGTG TTTTTTAAGC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336629 (GAM336629) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336629 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336629 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336629 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336629 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336629 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336629 precursor RNA is designated SEQ ID:6501, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6501 is located from position 33138970 to position 33139049 relative to chromosome 17 on the `+` strand.

GAM336629 precursor RNA folds onto itself, forming GAM336629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336629 precursor RNA, designated SEQ ID NO: 6501, and a schematic representation of a predicted secondary folding of GAM336629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336629 folded precursor RNA yielding a GAM336629 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336629 RNA, hereby incorporated herein.

GAM336629 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336629 target RNA, herein designated GAM TARGET RNA.

GAM336629 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336629 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336629 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336629 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336629 RNA, herein designated GAM RNA, to target binding sites on GAM336629 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336629 target RNA into GAM336629 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336629 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336629 target genes. The mRNA of each one of this plurality of GAM336629 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336629 RNA, herein designated GAM RNA, and which when bound by GAM336629 RNA causes inhibition of translation of the GAM336629 target mRNA into a corresponding GAM336629 target protein.

The mechanism of the translational inhibition exerted by GAM336629 RNA, herein designated GAM RNA, on one or more GAM336629 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336629 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336629 RNA, herein designated GAM RNA, of GAM336629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336629 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336629 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336629 RNA correlate with, and may be deduced from, the identity of the GAM336629 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAGTGAGCCA GAM336630 is a novel bioinformatically detectable regulatory, non protein
ATATCGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336630 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGCAAG encoded by the human genome.

ACTCCGTCTC GAM336630 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
G GAM336630 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336630 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336630 precursor RNA is designated SEQ ID:7165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7165 is located from position 33338251 to position 33338351 relative to chromosome 9 on the `+` strand.

GAM336630 precursor RNA folds onto itself, forming GAM336630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336630 precursor RNA, designated SEQ ID NO: 7165, and a schematic representation of a predicted secondary folding of GAM336630 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336630 folded precursor RNA yielding a GAM336630 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336630 RNA, hereby incorporated herein. Expression of GAM336630 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336630 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336630 target RNA, herein designated GAM TARGET RNA.

GAM336630 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336630 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336630 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336630 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336630 RNA, herein designated GAM RNA, to target binding sites on GAM336630 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336630 target RNA into GAM336630 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336630 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336630 target genes. The mRNA of each one of this plurality of GAM336630 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336630 RNA, herein designated GAM RNA, and which when bound by GAM336630 RNA causes inhibition of translation of the GAM336630 target mRNA into a corresponding GAM336630 target protein.

The mechanism of the translational inhibition exerted by GAM336630 RNA, herein designated GAM RNA, on one or more GAM336630 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336630 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336630 RNA, herein designated GAM RNA, of GAM336630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336630 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336630 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336630 RNA correlate with, and may be deduced from, the identity of the GAM336630 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336631 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGACTCC encoded by the human genome.

GAM336631 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336631 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336631 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336631 precursor RNA is designated SEQ ID:6699, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6699 is located from position 33338258 to position 33338345 relative to chromosome 9 on the `+` strand.

GAM336631 precursor RNA folds onto itself, forming GAM336631 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336631 precursor RNA, designated SEQ ID NO: 6699, and a schematic representation of a predicted secondary folding of GAM336631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336631 folded precursor RNA yielding a GAM336631 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336631 RNA, hereby incorporated herein. Expression of GAM336631 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336631 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336631 target RNA, herein designated GAM TARGET RNA.

GAM336631 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336631 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336631 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336631 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336631 RNA, herein designated GAM RNA, to target binding sites on GAM336631 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336631 target RNA into GAM336631 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336631 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336631 target genes. The mRNA of each one of this

plurality of GAM336631 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336631 RNA, herein designated GAM RNA, and which when bound by GAM336631 RNA causes inhibition of translation of the GAM336631 target mRNA into a corresponding GAM336631 target protein.

The mechanism of the translational inhibition exerted by GAM336631 RNA, herein designated GAM RNA, on one or more GAM336631 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336631 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336631 RNA, herein designated GAM RNA, of GAM336631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336631 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336631 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336631 RNA correlate with, and may be deduced from, the identity of the GAM336631 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336632 6063 CCATGTTAAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCCTGGTAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGATGACAGC Messenger 336632 (GAM336632) oligonucleotides modulates expression of respective target

ACTGTGATTA genes whose function and utility is known in the art.

TATAGGAGTG GAM336632 is a novel bioinformatically detectable regulatory, non protein

TGTCCTTGGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336632 was detected

GTTTGGGAAT is described with additional reference to Figs. 9-15.

TACATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336632 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336632 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336632 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336632 precursor RNA is designated SEQ ID:6063, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6063 is located from position 33407353 to position 33407429 relative to chromosome 17 on the `-` strand.

GAM336632 precursor RNA folds onto itself, forming GAM336632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336632 precursor RNA, designated SEQ ID NO: 6063, and a schematic representation of a predicted secondary folding of GAM336632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336632 folded precursor RNA yielding a GAM336632 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336632 RNA, hereby incorporated herein.

GAM336632 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336632 target RNA, herein designated GAM TARGET RNA.

GAM336632 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336632 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336632 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336632 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336632 RNA, herein designated GAM RNA, to target binding sites on GAM336632 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336632 target RNA into GAM336632 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336632 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336632 target genes. The mRNA of each one of this plurality of GAM336632 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336632 RNA, herein designated GAM RNA, and which when bound by GAM336632 RNA causes inhibition of translation of the GAM336632 target mRNA into a corresponding GAM336632 target protein.

The mechanism of the translational inhibition exerted by GAM336632 RNA, herein designated GAM RNA, on one or more GAM336632 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336632 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336632 RNA, herein designated GAM RNA, of GAM336632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336632 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336632 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336632 RNA correlate with, and may be deduced from, the identity of the GAM336632 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336633 7318 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGGGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGATTGCAG Messenger 336633 (GAM336633) oligonucleotides modulates expression of respective target

TGAGCTGAGA genes whose function and utility is known in the art.

TCATGCCACT GAM336633 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336633 was detected

CTGGGCGACA is described with additional reference to Figs. 9-15.

GAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336633 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336633 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336633 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336633 precursor RNA is designated SEQ ID:7318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7318 is located from position 33688439 to position 33688514 relative to chromosome 20 on the `+` strand.

GAM336633 precursor RNA folds onto itself, forming GAM336633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336633 precursor RNA, designated SEQ ID NO: 7318, and a schematic representation of a predicted secondary folding of GAM336633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336633 folded precursor RNA yielding a GAM336633 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336633 RNA, hereby incorporated herein.

GAM336633 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336633 target RNA, herein designated GAM TARGET RNA.

GAM336633 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336633 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336633 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336633 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336633 RNA, herein designated GAM RNA, to target binding sites on GAM336633 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336633 target RNA into GAM336633 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336633 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336633 target genes. The mRNA of each one of this plurality of GAM336633 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336633 RNA, herein designated GAM RNA, and which when bound by GAM336633 RNA causes inhibition of translation of the GAM336633 target mRNA into a corresponding GAM336633 target protein.

The mechanism of the translational inhibition exerted by GAM336633 RNA, herein designated GAM RNA, on one or more GAM336633 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336633 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336633 RNA, herein designated GAM RNA, of GAM336633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336633 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336633 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336633 RNA correlate with, and may be deduced from, the identity of the GAM336633 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336634 6318 GAGAAGATAA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGCGTTTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGGATGTCA Messenger 336634 (GAM336634) oligonucleotides modulates expression of respective target

TCTTGGGCCT genes whose function and utility is known in the art.

GCTTTTCTCT GAM336634 is a novel bioinformatically detectable regulatory, non protein
GATCGTGTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336634 was detected
CGATGGGCTC is described with additional reference to Figs. 9-15.

ATTTTGCAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATTTATACC encoded by the human genome.

TGATGGCCGT GAM336634 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAACCTATCT GAM336634 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TCTC GAM336634 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336634 precursor RNA is designated SEQ ID:6318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6318 is located from position 33692940 to position 33693053 relative to chromosome 10 on the `+` strand.

GAM336634 precursor RNA folds onto itself, forming GAM336634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336634 precursor RNA, designated SEQ ID NO: 6318, and a schematic representation of a predicted secondary folding of GAM336634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336634 folded precursor RNA yielding a GAM336634 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336634 RNA, hereby incorporated herein.

GAM336634 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336634 target RNA, herein designated GAM TARGET RNA.

GAM336634 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336634 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336634 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336634 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336634 RNA, herein designated GAM RNA, to target binding sites on GAM336634 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336634 target RNA into GAM336634 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336634 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336634 target genes. The mRNA of each one of this plurality of GAM336634 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336634 RNA, herein designated GAM RNA, and which when bound by GAM336634 RNA causes inhibition of translation of the GAM336634 target mRNA into a corresponding GAM336634 target protein.

The mechanism of the translational inhibition exerted by GAM336634 RNA, herein designated GAM RNA, on one or more GAM336634 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336634 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336634 RNA, herein designated GAM RNA, of GAM336634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336634 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336634 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336634 RNA correlate with, and may be deduced from, the identity of the GAM336634 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336637 6869 GTATGGGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically
ACTTGGGGCG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGATGTCAGC Messenger 336637 (GAM336637) oligonucleotides modulates expression of respective target
CAGAGTCCTT genes whose function and utility is known in the art.

CCACCAAGGC GAM336637 is a novel bioinformatically detectable regulatory, non protein
TTTTATGGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336637 was detected
TTACGTGATC is described with additional reference to Figs. 9-15.

CACCACCCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTAAC encoded by the human genome.

GAM336637 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336637 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336637 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336637 precursor RNA is designated SEQ ID:6869, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6869 is located from position 33804195 to position 33804279 relative to chromosome 11 on the `+` strand.

GAM336637 precursor RNA folds onto itself, forming GAM336637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336637 precursor RNA, designated SEQ ID NO: 6869, and a schematic representation of a predicted secondary folding of GAM336637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336637 folded precursor RNA yielding a GAM336637 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336637 RNA, hereby incorporated herein.

GAM336637 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336637 target RNA, herein designated GAM TARGET RNA.

GAM336637 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336637 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336637 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336637 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336637 RNA, herein designated GAM RNA, to target binding sites on GAM336637 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336637 target RNA into GAM336637 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336637 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336637 target genes. The mRNA of each one of this plurality of GAM336637 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336637 RNA, herein designated GAM RNA, and which when bound by GAM336637 RNA causes inhibition of translation of the GAM336637 target mRNA into a corresponding GAM336637 target protein.

The mechanism of the translational inhibition exerted by GAM336637 RNA, herein designated GAM RNA, on one or more GAM336637 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336637 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336637 RNA, herein designated GAM RNA, of GAM336637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336637 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336637 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336637 RNA correlate with, and may be deduced from, the identity of the GAM336637 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336638 5857 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336638 (GAM336638) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336638 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336638 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336638 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336638 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336638 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336638 precursor RNA is designated SEQ ID:5857, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5857 is located from position 33909250 to position 33909331 relative to chromosome 13 on the `+` strand.

GAM336638 precursor RNA folds onto itself, forming GAM336638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336638 precursor RNA, designated SEQ ID NO: 5857, and a schematic representation of a predicted secondary folding of GAM336638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336638 folded precursor RNA yielding a GAM336638 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336638 RNA, hereby incorporated herein.

GAM336638 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336638 target RNA, herein designated GAM TARGET RNA.

GAM336638 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336638 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336638 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336638 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336638 RNA, herein designated GAM RNA, to target binding sites on GAM336638 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336638 target RNA into GAM336638 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336638 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336638 target genes. The mRNA of each one of this plurality of GAM336638 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336638 RNA, herein designated GAM RNA, and which when bound by GAM336638 RNA causes inhibition of translation of the GAM336638 target mRNA into a corresponding GAM336638 target protein.

The mechanism of the translational inhibition exerted by GAM336638 RNA, herein designated GAM RNA, on one or more GAM336638 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336638 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336638 RNA, herein designated GAM RNA, of GAM336638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336638 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336638 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336638 RNA correlate with, and may be deduced from, the identity of the GAM336638 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336639 6508 GCCCTTAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

ATTGTTATGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGTCCCAGA Messenger 336639 (GAM336639) oligonucleotides modulates expression of respective target

AATCCAGGCT genes whose function and utility is known in the art.

TAAATGATAC GAM336639 is a novel bioinformatically detectable regulatory, non protein

TCAGGTGTAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336639 was detected

TATTCAAGAT is described with additional reference to Figs. 9-15.

AAGGGTCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGAATATAA encoded by the human genome.

AATATTAATT GAM336639 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGAGGGT GAM336639 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336639 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336639 precursor RNA is designated SEQ ID:6508, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6508 is located from position 33928191 to position 33928297 relative to chromosome 11 on the `-` strand.

GAM336639 precursor RNA folds onto itself, forming GAM336639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336639 precursor RNA, designated SEQ ID NO: 6508, and a schematic representation of a predicted secondary folding of GAM336639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336639 folded precursor RNA yielding a GAM336639 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336639 RNA, hereby incorporated herein.

GAM336639 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336639 target RNA, herein designated GAM TARGET RNA.

GAM336639 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336639 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336639 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336639 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336639 RNA, herein designated GAM RNA, to target binding sites on GAM336639 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336639 target RNA into GAM336639 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336639 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336639 target genes. The mRNA of each one of this plurality of GAM336639 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336639 RNA, herein designated GAM RNA, and which when bound by GAM336639 RNA causes inhibition of translation of the GAM336639 target mRNA into a corresponding GAM336639 target protein.

The mechanism of the translational inhibition exerted by GAM336639 RNA, herein designated GAM RNA, on one or more GAM336639 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336639 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336639 RNA, herein designated GAM RNA, of GAM336639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336639 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336639 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336639 RNA correlate with, and may be deduced from, the identity of the GAM336639 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336640 6857 GGTTGGAATG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGAAGGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGGTCTTCGG Messenger 336640 (GAM336640) oligonucleotides modulates expression of respective target

CTAAAATTTG genes whose function and utility is known in the art.

CATAAAACGG GAM336640 is a novel bioinformatically detectable regulatory, non protein

AACCCATCCG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336640 was detected

GGCGATTCCA is described with additional reference to Figs. 9-15.

ACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336640 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336640 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336640 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336640 precursor RNA is designated SEQ ID:6857, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6857 is located from position 33934627 to position 33934699 relative to chromosome 21 on the `-` strand.

GAM336640 precursor RNA folds onto itself, forming GAM336640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336640 precursor RNA, designated SEQ ID NO: 6857, and a schematic representation of a predicted secondary folding of GAM336640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336640 folded precursor RNA yielding a GAM336640 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336640 RNA, hereby incorporated herein.

GAM336640 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336640 target RNA, herein designated GAM TARGET RNA.

GAM336640 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336640 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336640 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336640 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336640 RNA, herein designated GAM RNA, to target binding sites on GAM336640 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336640 target RNA into GAM336640 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336640 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336640 target genes. The mRNA of each one of this plurality of GAM336640 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM336640 RNA, herein designated GAM RNA, and which when bound by GAM336640 RNA causes inhibition of translation of the GAM336640 target mRNA into a corresponding GAM336640 target protein.

The mechanism of the translational inhibition exerted by GAM336640 RNA, herein designated GAM RNA, on one or more GAM336640 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336640 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336640 RNA, herein designated GAM RNA, of GAM336640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336640 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336640 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336640 RNA correlate with, and may be deduced from, the identity of the GAM336640 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336642 6849 GGTGGTAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CATATAGGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336642 was detected
CCCCCAAACC is described with additional reference to Figs. 9-15.

TGCCTATACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCAGGCCAGG encoded by the human genome.

CCCC GAM336642 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336642 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336642 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336642 precursor RNA is designated SEQ ID:6849, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6849 is located from position 34257285 to position 34257378 relative to chromosome 21 on the `+` strand.

GAM336642 precursor RNA folds onto itself, forming GAM336642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336642 precursor RNA, designated SEQ ID NO: 6849, and a schematic representation of a predicted secondary folding of GAM336642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336642 folded precursor RNA yielding a GAM336642 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336642 RNA, hereby incorporated herein.

GAM336642 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336642 target RNA, herein designated GAM TARGET RNA.

GAM336642 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336642 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336642 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336642 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336642 RNA, herein designated GAM RNA, to target binding sites on GAM336642 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336642 target RNA into GAM336642 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336642 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336642 target genes. The mRNA of each one of this plurality of GAM336642 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336642 RNA, herein designated GAM RNA, and which when bound by GAM336642 RNA causes inhibition of translation of the GAM336642 target mRNA into a corresponding GAM336642 target protein.

The mechanism of the translational inhibition exerted by GAM336642 RNA, herein designated GAM RNA, on one or more GAM336642 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336642 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336642 RNA, herein designated GAM RNA, of GAM336642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336642 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336642 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336642 RNA correlate with, and may be deduced from, the identity of the GAM336642 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336643 6850 GGTGGTAAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCTGGAGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCAGGAAC Messenger 336643 (GAM336643) oligonucleotides modulates expression of respective target

CCCAAAGCCC genes whose function and utility is known in the art.

TATGACACCC GAM336643 is a novel bioinformatically detectable regulatory, non protein

CATATAGGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336643 was detected

CCCCCAAACC is described with additional reference to Figs. 9-15.

TGCCTATACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCAGGCCAGG encoded by the human genome.

CCCCC GAM336643 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336643 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336643 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336643 precursor RNA is designated SEQ ID:6850, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6850 is located from position 34257285 to position 34257379 relative to chromosome 21 on the `+` strand.

GAM336643 precursor RNA folds onto itself, forming GAM336643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336643 precursor RNA, designated SEQ ID NO: 6850, and a schematic representation of a predicted secondary folding of GAM336643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336643 folded precursor RNA yielding a GAM336643 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336643 RNA, hereby incorporated herein.

GAM336643 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336643 target RNA, herein designated GAM TARGET RNA.

GAM336643 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336643 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336643 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336643 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336643 RNA, herein designated GAM RNA, to target binding sites on GAM336643 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336643 target RNA into GAM336643 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336643 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336643 target genes. The mRNA of each one of this plurality of GAM336643 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336643 RNA, herein designated GAM RNA, and which when bound by GAM336643 RNA causes inhibition of translation of the GAM336643 target mRNA into a corresponding GAM336643 target protein.

The mechanism of the translational inhibition exerted by GAM336643 RNA, herein designated GAM RNA, on one or more GAM336643 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336643 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336643 RNA, herein designated GAM RNA, of GAM336643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336643 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336643 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336643 RNA correlate with, and may be deduced from, the identity of the GAM336643 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336646 6571 GGAAAAGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GATGTAAAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336646 was detected

AGCTGTACCT is described with additional reference to Figs. 9-15.

TCTGAGAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTAGCCCCAT encoded by the human genome.

GTCTTCATC GAM336646 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336646 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336646 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336646 precursor RNA is designated SEQ ID:6571, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6571 is located from position 34615664 to position 34615762 relative to chromosome 17 on the `+` strand.

GAM336646 precursor RNA folds onto itself, forming GAM336646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336646 precursor RNA, designated SEQ ID NO: 6571, and a schematic representation of a predicted secondary folding of GAM336646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336646 folded precursor RNA yielding a GAM336646 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336646 RNA, hereby incorporated herein.

GAM336646 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336646 target RNA, herein designated GAM TARGET RNA.

GAM336646 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336646 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336646 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336646 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336646 RNA, herein designated GAM RNA, to target binding sites on GAM336646 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336646 target RNA into GAM336646 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336646 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336646 target genes. The mRNA of each one of this plurality of GAM336646 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336646 RNA, herein designated GAM RNA, and which when bound by GAM336646 RNA causes inhibition of translation of the GAM336646 target mRNA into a corresponding GAM336646 target protein.

The mechanism of the translational inhibition exerted by GAM336646 RNA, herein designated GAM RNA, on one or more GAM336646 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336646 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336646 RNA, herein designated GAM RNA, of GAM336646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336646 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336646 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336646

RNA correlate with, and may be deduced from, the identity of the GAM336646 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336651 (GAM336651) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336651 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336651 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336651 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336651 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336651 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336651 precursor RNA is designated SEQ ID:6157, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6157 is located from position 34790992 to position 34791065 relative to chromosome 7 on the `+` strand.

GAM336651 precursor RNA folds onto itself, forming GAM336651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336651 precursor RNA, designated SEQ ID NO: 6157, and a schematic representation of a predicted secondary folding of GAM336651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336651 folded precursor RNA yielding a GAM336651 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336651 RNA, hereby incorporated herein.

GAM336651 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336651 target RNA, herein designated GAM TARGET RNA.

GAM336651 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336651 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336651 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336651 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336651 RNA, herein designated GAM RNA, to target binding sites on GAM336651 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336651 target RNA into GAM336651 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336651 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336651 target genes. The mRNA of each one of this plurality of GAM336651 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336651 RNA, herein designated GAM RNA, and which when bound by GAM336651 RNA causes inhibition of translation of the GAM336651 target mRNA into a corresponding GAM336651 target protein.

The mechanism of the translational inhibition exerted by GAM336651 RNA, herein designated GAM RNA, on one or more GAM336651 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336651 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336651 RNA, herein designated GAM RNA, of GAM336651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336651 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336651 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336651 RNA correlate with, and may be deduced from, the identity of the GAM336651 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336652 5787 AGGGAGAGTC Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGTTTGAG Messenger 336652 (GAM336652) oligonucleotides modulates expression of respective target
CCTTCTCCTG genes whose function and utility is known in the art.

CTCTGTCCGT GAM336652 is a novel bioinformatically detectable regulatory, non protein
GGAGCAAGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336652 was detected
AAATAAATGC is described with additional reference to Figs. 9-15.

TGAGACCGTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCTCCTCAT encoded by the human genome.

TTCTCCTT GAM336652 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336652 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336652 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336652 precursor RNA is designated SEQ ID:5787, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5787 is located from position 34813290 to position 34813387 relative to chromosome 21 on the `-` strand.

GAM336652 precursor RNA folds onto itself, forming GAM336652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336652 precursor RNA, designated SEQ ID NO: 5787, and a schematic representation of a predicted secondary folding of GAM336652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336652 folded precursor RNA yielding a GAM336652 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336652 RNA, hereby incorporated herein.

GAM336652 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336652 target RNA, herein designated GAM TARGET RNA.

GAM336652 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336652 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336652 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336652 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336652 RNA, herein designated GAM RNA, to target binding sites on GAM336652 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336652 target RNA into GAM336652 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336652 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336652 target genes. The mRNA of each one of this plurality of GAM336652 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336652 RNA, herein designated GAM RNA, and which when bound by GAM336652 RNA causes inhibition of translation of the GAM336652 target mRNA into a corresponding GAM336652 target protein.

The mechanism of the translational inhibition exerted by GAM336652 RNA, herein designated GAM RNA, on one or more GAM336652 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336652 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336652 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336652 RNA, herein designated GAM RNA, of GAM336652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336652 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336652 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336652 RNA correlate with, and may be deduced from, the identity of the GAM336652 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336653 6455 GAGGTGGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCCAGGAGG Messenger 336653 (GAM336653) oligonucleotides modulates expression of respective target

TCAAGGCTGC genes whose function and utility is known in the art.

AGTGAGTTGT GAM336653 is a novel bioinformatically detectable regulatory, non protein

GATCATGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336653 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAAGCAAGA encoded by the human genome.

CCCCATCTC GAM336653 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336653 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336653 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336653 precursor RNA is designated SEQ ID:6455, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6455 is located from position 34876504 to position 34876602 relative to chromosome 19 on the `-` strand.

GAM336653 precursor RNA folds onto itself, forming GAM336653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336653 precursor RNA, designated SEQ ID NO: 6455, and a schematic representation of a predicted secondary folding of GAM336653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336653 folded precursor RNA yielding a GAM336653 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336653 RNA, hereby incorporated herein. Expression of GAM336653 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336653 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336653 target RNA, herein designated GAM TARGET RNA.

GAM336653 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336653 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336653 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336653 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336653 RNA, herein designated GAM RNA, to target binding sites on GAM336653 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336653 target RNA into GAM336653 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336653 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336653 target genes. The mRNA of each one of this plurality of GAM336653 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336653 RNA, herein designated GAM RNA, and which when bound by GAM336653 RNA causes inhibition of

translation of the GAM336653 target mRNA into a corresponding GAM336653 target protein.

The mechanism of the translational inhibition exerted by GAM336653 RNA, herein designated GAM RNA, on one or more GAM336653 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336653 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336653 RNA, herein designated GAM RNA, of GAM336653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336653 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336653 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336653 RNA correlate with, and may be deduced from, the identity of the GAM336653 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336656 5858 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336656 (GAM336656) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336656 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336656 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336656 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336656 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336656 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336656 precursor RNA is designated SEQ ID:5858, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5858 is located from position 35023682 to position 35023763 relative to chromosome 3 on the `+` strand.

GAM336656 precursor RNA folds onto itself, forming GAM336656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336656 precursor RNA, designated SEQ ID NO: 5858, and a schematic representation of a predicted secondary folding of GAM336656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336656 folded precursor RNA yielding a GAM336656 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336656 RNA, hereby incorporated herein.

GAM336656 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336656 target RNA, herein designated GAM TARGET RNA.

GAM336656 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336656 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336656 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336656 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336656 RNA, herein designated GAM RNA, to target binding sites on GAM336656 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336656 target RNA into GAM336656 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336656 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336656 target genes. The mRNA of each one of this plurality of GAM336656 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336656 RNA, herein designated GAM RNA, and which when bound by GAM336656 RNA causes inhibition of translation of the GAM336656 target mRNA into a corresponding GAM336656 target protein.

The mechanism of the translational inhibition exerted by GAM336656 RNA, herein designated GAM RNA, on one or more GAM336656 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336656 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336656 RNA, herein designated GAM RNA, of GAM336656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336656 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336656 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336656 RNA correlate with, and may be deduced from, the identity of the GAM336656 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GCTTGGCACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CACTAAAGCC encoded by the human genome.

ATCATAAACC GAM336657 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336657 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336657 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336657 precursor RNA is designated SEQ ID:7258, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7258 is located from position 35289635 to position 35289735 relative to chromosome 11 on the `+` strand.

GAM336657 precursor RNA folds onto itself, forming GAM336657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336657 precursor RNA, designated SEQ ID NO: 7258, and a schematic representation of a predicted secondary folding of GAM336657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336657 folded precursor RNA yielding a GAM336657 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336657 RNA, hereby incorporated herein.

GAM336657 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336657 target RNA, herein designated GAM TARGET RNA.

GAM336657 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336657 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336657 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336657 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336657 RNA, herein designated GAM RNA, to target binding sites on GAM336657 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336657 target RNA into GAM336657 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336657 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336657 target genes. The mRNA of each one of this plurality of GAM336657 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336657 RNA, herein designated GAM RNA, and which when bound by GAM336657 RNA causes inhibition of translation of the GAM336657 target mRNA into a corresponding GAM336657 target protein.

The mechanism of the translational inhibition exerted by GAM336657 RNA, herein designated GAM RNA, on one or more GAM336657 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336657 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336657 RNA, herein designated GAM RNA, of GAM336657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336657 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336657 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336657 RNA correlate with, and may be deduced from, the identity of the GAM336657 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336658 6775 GGGAAGAACT Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCAATCTAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCACACGTC Messenger 336658 (GAM336658) oligonucleotides modulates expression of respective target

TCTCTGAATT genes whose function and utility is known in the art.

GTTGATTATG GAM336658 is a novel bioinformatically detectable regulatory, non protein
CGCTTTATGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336658 was detected
AGAGATTTTT is described with additional reference to Figs. 9-15.

CAATCTCGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCTTTACTT encoded by the human genome.

TGTGTGGTTT GAM336658 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AGACCC GAM336658 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336658 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336658 precursor RNA is designated SEQ ID:6775, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6775 is located from position 35608725 to position 35608830 relative to chromosome 17 on the `-` strand.

GAM336658 precursor RNA folds onto itself, forming GAM336658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336658 precursor RNA, designated SEQ ID NO: 6775, and a schematic representation of a predicted secondary folding of GAM336658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336658 folded precursor RNA yielding a GAM336658 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336658 RNA, hereby incorporated herein.

GAM336658 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336658 target RNA, herein designated GAM TARGET RNA.

GAM336658 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336658 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336658 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336658 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336658 RNA, herein designated GAM RNA, to target binding sites on GAM336658 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336658 target RNA into GAM336658 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336658 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336658 target genes. The mRNA of each one of this plurality of GAM336658 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336658 RNA, herein designated GAM RNA, and which when bound by GAM336658 RNA causes inhibition of translation of the GAM336658 target mRNA into a corresponding GAM336658 target protein.

The mechanism of the translational inhibition exerted by GAM336658 RNA, herein designated GAM RNA, on one or more GAM336658 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336658 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336658 RNA, herein designated GAM RNA, of GAM336658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336658 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336658 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336658 RNA correlate with, and may be deduced from, the identity of the GAM336658 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336659 6335 GAGAATTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAACCCGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTGGAGGT Messenger 336659 (GAM336659) oligonucleotides modulates expression of respective target

TGCAGTGACT genes whose function and utility is known in the art.

GAGATCGGGC GAM336659 is a novel bioinformatically detectable regulatory, non protein

CACTGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336659 was detected

CAGCCTGGGC is described with additional reference to Figs. 9-15.

AACAGAGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACTC encoded by the human genome.

GAM336659 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336659 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336659 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336659 precursor RNA is designated SEQ ID:6335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6335 is located from position 35681759 to position 35681843 relative to chromosome 22 on the `-` strand.

GAM336659 precursor RNA folds onto itself, forming GAM336659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336659 precursor RNA, designated SEQ ID NO: 6335, and a schematic representation of a predicted secondary folding of GAM336659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336659 folded precursor RNA yielding a GAM336659 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336659 RNA, hereby incorporated herein. Expression of GAM336659 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336659 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336659 target RNA, herein designated GAM TARGET RNA.

GAM336659 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336659 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336659 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336659 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336659 RNA, herein designated GAM RNA, to target binding sites on GAM336659 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336659 target RNA into GAM336659 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336659 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336659 target genes. The mRNA of each one of this plurality of GAM336659 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336659 RNA, herein designated GAM RNA, and which when bound by GAM336659 RNA causes inhibition of translation of the GAM336659 target mRNA into a corresponding GAM336659 target protein.

The mechanism of the translational inhibition exerted by GAM336659 RNA, herein designated GAM RNA, on one or more GAM336659 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336659 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336659 RNA, herein designated GAM RNA, of GAM336659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336659 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336659 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336659 RNA correlate with, and may be deduced from, the identity of the GAM336659 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336660 5859 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TATGTATACA GAM336660 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336660 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336660 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336660 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336660 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336660 precursor RNA is designated SEQ ID:5859, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5859 is located from position 35708263 to position 35708344 relative to chromosome X on the `-` strand.

GAM336660 precursor RNA folds onto itself, forming GAM336660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336660 precursor RNA, designated SEQ ID NO: 5859, and a schematic representation of a predicted secondary folding of GAM336660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336660 folded precursor

RNA yielding a GAM336660 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336660 RNA, hereby incorporated herein.

GAM336660 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336660 target RNA, herein designated GAM TARGET RNA.

GAM336660 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336660 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336660 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336660 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336660 RNA, herein designated GAM RNA, to target binding sites on GAM336660 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336660 target RNA into GAM336660 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336660 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336660 target genes. The mRNA of each one of this plurality of GAM336660 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336660 RNA, herein designated GAM RNA, and which when bound by GAM336660 RNA causes inhibition of translation of the GAM336660 target mRNA into a corresponding GAM336660 target protein.

The mechanism of the translational inhibition exerted by GAM336660 RNA, herein designated GAM RNA, on one or more GAM336660 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336660 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336660 RNA, herein designated GAM RNA, of GAM336660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336660 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336660 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336660 RNA correlate with, and may be deduced from, the identity of the GAM336660 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCGGGAGGTG Messenger 336662 (GAM336662) oligonucleotides modulates expression of respective target

GAGGTTGCAG genes whose function and utility is known in the art.

TGAGCCGAGA GAM336662 is a novel bioinformatically detectable regulatory, non protein

TCGCGCCATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336662 was detected

GCACTCCAGC is described with additional reference to Figs. 9-15.

CTGGGCAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGCAAGACT encoded by the human genome.

CTGTC GAM336662 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336662 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336662 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336662 precursor RNA is designated SEQ

ID:6753, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6753 is located from position 35736488 to position 35736582 relative to chromosome 20 on the `+` strand.

GAM336662 precursor RNA folds onto itself, forming GAM336662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336662 precursor RNA, designated SEQ ID NO: 6753, and a schematic representation of a predicted secondary folding of GAM336662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336662 folded precursor RNA yielding a GAM336662 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336662 RNA, hereby incorporated herein. Expression of GAM336662 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336662 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336662 target RNA, herein designated GAM TARGET RNA.

GAM336662 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336662 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336662 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336662 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336662 RNA, herein designated GAM RNA, to target binding sites on GAM336662 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336662 target RNA

into GAM336662 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336662 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336662 target genes. The mRNA of each one of this plurality of GAM336662 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336662 RNA, herein designated GAM RNA, and which when bound by GAM336662 RNA causes inhibition of translation of the GAM336662 target mRNA into a corresponding GAM336662 target protein.

The mechanism of the translational inhibition exerted by GAM336662 RNA, herein designated GAM RNA, on one or more GAM336662 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336662 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336662 RNA, herein designated GAM RNA, of GAM336662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336662 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336662 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336662 RNA correlate with, and may be deduced from, the identity of the GAM336662 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336663 6689 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 336663 (GAM336663) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM336663 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336663 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGACTCT encoded by the human genome.

GAM336663 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336663 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336663 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336663 precursor RNA is designated SEQ ID:6689, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6689 is located from position 35736492 to position 35736579 relative to chromosome 20 on the `+` strand.

GAM336663 precursor RNA folds onto itself, forming GAM336663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336663 precursor RNA, designated SEQ ID NO: 6689, and a schematic representation of a predicted secondary folding of GAM336663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336663 folded precursor RNA yielding a GAM336663 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336663 RNA, hereby incorporated herein. Expression of GAM336663 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336663 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336663 target RNA, herein designated GAM TARGET RNA.

GAM336663 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336663 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336663 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336663 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336663 RNA, herein designated GAM RNA, to target binding sites on GAM336663 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336663 target RNA into GAM336663 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336663 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336663 target genes. The mRNA of each one of this plurality of GAM336663 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336663 RNA, herein designated GAM RNA, and which when bound by GAM336663 RNA causes inhibition of translation of the GAM336663 target mRNA into a corresponding GAM336663 target protein.

The mechanism of the translational inhibition exerted by GAM336663 RNA, herein designated GAM RNA, on one or more GAM336663 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336663 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336663 RNA, herein designated GAM RNA, of GAM336663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336663 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336663 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336663 RNA correlate with, and may be deduced from, the identity of the GAM336663 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336664 7320 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCGGGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 336664 (GAM336664) oligonucleotides modulates expression of respective target

TGAGCCGAGA genes whose function and utility is known in the art.

TCGCGCCATT GAM336664 is a novel bioinformatically detectable regulatory, non protein
GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336664 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

GAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336664 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336664 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336664 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336664 precursor RNA is designated SEQ ID:7320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7320 is located from position 35736498 to position 35736573 relative to chromosome 20 on the `+` strand.

GAM336664 precursor RNA folds onto itself, forming GAM336664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336664 precursor RNA, designated SEQ ID NO: 7320, and a schematic representation of a predicted secondary folding of GAM336664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336664 folded precursor RNA yielding a GAM336664 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336664 RNA, hereby incorporated herein. Expression of GAM336664 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336664 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336664 target RNA, herein designated GAM TARGET RNA.

GAM336664 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336664 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336664 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336664 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336664 RNA, herein designated GAM RNA, to target binding sites on GAM336664 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336664 target RNA into GAM336664 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336664 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336664 target genes. The mRNA of each one of this plurality of GAM336664 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336664 RNA, herein designated GAM RNA, and which when bound by GAM336664 RNA causes inhibition of translation of the GAM336664 target mRNA into a corresponding GAM336664 target protein.

The mechanism of the translational inhibition exerted by GAM336664 RNA, herein designated GAM RNA, on one or more GAM336664 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336664 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336664 RNA, herein designated GAM RNA, of GAM336664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336664 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336664 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336664 RNA correlate with, and may be deduced from, the identity of the GAM336664 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336665 6511 GCCTCTGGAC Fig. 8 further provides a conceptual description of another novel bioinformatically
AATACTGTTA detected oligonucleotides of the present invention, referred to here as Genomic Address
AAACTAAATA Messenger 336665 (GAM336665) oligonucleotides modulates expression of respective target
CTTGCCAGGT genes whose function and utility is known in the art.

GTGGTGGCTC GAM336665 is a novel bioinformatically detectable regulatory, non protein
ACACCTGTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336665 was detected
TAGTTCTTTT is described with additional reference to Figs. 9-15.

GGAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336665 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336665 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336665 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336665 precursor RNA is designated SEQ ID:6511, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6511 is located from position 35840280 to position 35840355 relative to chromosome 17 on the `+` strand.

GAM336665 precursor RNA folds onto itself, forming GAM336665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336665 precursor RNA, designated SEQ ID NO: 6511, and a schematic representation of a predicted secondary folding of GAM336665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336665 folded precursor RNA yielding a GAM336665 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336665 RNA, hereby incorporated herein.

GAM336665 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336665 target RNA, herein designated GAM TARGET RNA.

GAM336665 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336665 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336665 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336665 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336665 RNA, herein designated GAM RNA, to target binding sites on GAM336665 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336665 target RNA into GAM336665 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336665 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336665 target genes. The mRNA of each one of this plurality of GAM336665 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336665 RNA, herein designated GAM RNA, and which when bound by GAM336665 RNA causes inhibition of translation of the GAM336665 target mRNA into a corresponding GAM336665 target protein.

The mechanism of the translational inhibition exerted by GAM336665 RNA, herein designated GAM RNA, on one or more GAM336665 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336665 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336665 RNA, herein designated GAM RNA, of GAM336665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336665 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336665 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336665 RNA correlate with, and may be deduced from, the identity of the GAM336665 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336669 5860 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336669 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336669 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336669 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336669 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336669 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336669 precursor RNA is designated SEQ ID:5860, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5860 is located from position 36383567 to position 36383648 relative to chromosome 2 on the `+` strand.

GAM336669 precursor RNA folds onto itself, forming GAM336669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336669 precursor RNA, designated SEQ ID NO: 5860, and a schematic representation of a predicted secondary folding of GAM336669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336669 folded precursor RNA yielding a GAM336669 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336669 RNA, hereby incorporated herein.

GAM336669 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336669 target RNA, herein designated GAM TARGET RNA.

GAM336669 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336669 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336669 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336669 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336669 RNA, herein designated GAM RNA, to target binding sites on GAM336669 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336669 target RNA into GAM336669 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336669 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336669 target genes. The mRNA of each one of this plurality of GAM336669 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336669 RNA, herein designated GAM RNA, and which when bound by GAM336669 RNA causes inhibition of translation of the GAM336669 target mRNA into a corresponding GAM336669 target protein.

The mechanism of the translational inhibition exerted by GAM336669 RNA, herein designated GAM RNA, on one or more GAM336669 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336669 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336669 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336669 RNA, herein designated GAM RNA, of GAM336669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336669 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336669 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336669 RNA correlate with, and may be deduced from, the identity of the GAM336669 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336670 5653 AAATAGCCAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TCCCTCGTGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCATTCCTAA genes whose function and utility is known in the art.

TGCAGACTTA GAM336670 is a novel bioinformatically detectable regulatory, non protein

CAAAAACTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336670 was detected

GTGTAAGGCT is described with additional reference to Figs. 9-15.

GGCATTAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGGCCAGG encoded by the human genome.

ATGAGAGCAG GAM336670 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGCTTTTT GAM336670 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336670 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336670 precursor RNA is designated SEQ ID:5653, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5653 is located from position 36386596 to position 36386703 relative to chromosome 10 on the `-` strand.

GAM336670 precursor RNA folds onto itself, forming GAM336670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336670 precursor RNA, designated SEQ ID NO: 5653, and a schematic representation of a predicted secondary folding of GAM336670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336670 folded precursor RNA yielding a GAM336670 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336670 RNA, hereby incorporated herein.

GAM336670 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336670 target RNA, herein designated GAM TARGET RNA.

GAM336670 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336670 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336670 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336670 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336670 RNA, herein designated GAM RNA, to target binding sites on GAM336670 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336670 target RNA into GAM336670 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336670 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336670 target genes. The mRNA of each one of this plurality of GAM336670 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336670 RNA, herein designated GAM RNA, and which when bound by GAM336670 RNA causes inhibition of translation of the GAM336670 target mRNA into a corresponding GAM336670 target protein.

The mechanism of the translational inhibition exerted by GAM336670 RNA, herein designated GAM RNA, on one or more GAM336670 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336670 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336670 RNA, herein designated GAM RNA, of GAM336670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336670 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336670 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336670 RNA correlate with, and may be deduced from, the identity of the GAM336670 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336671 5748 AGCCATTCCC Fig. 8 further provides a conceptual description of another novel bioinformatically

TCGTGCTGCG detected oligonucleotides of the present invention, referred to here as Genomic Address

ACAGTTCCAT Messenger 336671 (GAM336671) oligonucleotides modulates expression of respective target

TCCTAATGCA genes whose function and utility is known in the art.

GACTTACAAA GAM336671 is a novel bioinformatically detectable regulatory, non protein

AACTAGGTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336671 was detected

AAGGCTGGCA is described with additional reference to Figs. 9-15.

TTAGGGTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCCAGGATGA encoded by the human genome.

GAGCAGGGCT GAM336671 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336671 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336671 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336671 precursor RNA is designated SEQ

ID:5748, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5748 is located from position 36386600 to position 36386699 relative to chromosome 10 on the `-` strand.

GAM336671 precursor RNA folds onto itself, forming GAM336671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336671 precursor RNA, designated SEQ ID NO: 5748, and a schematic representation of a predicted secondary folding of GAM336671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336671 folded precursor RNA yielding a GAM336671 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336671 RNA, hereby incorporated herein.

GAM336671 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336671 target RNA, herein designated GAM TARGET RNA.

GAM336671 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336671 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336671 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336671 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336671 RNA, herein designated GAM RNA, to target binding sites on GAM336671 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336671 target RNA into GAM336671 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336671 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336671 target genes. The mRNA of each one of this plurality of GAM336671 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336671 RNA, herein designated GAM RNA, and which when bound by GAM336671 RNA causes inhibition of translation of the GAM336671 target mRNA into a corresponding GAM336671 target protein.

The mechanism of the translational inhibition exerted by GAM336671 RNA, herein designated GAM RNA, on one or more GAM336671 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336671 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336671 RNA, herein designated GAM RNA, of GAM336671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336671 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336671 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336671 RNA correlate with, and may be deduced from, the identity of the GAM336671 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336672 6170 CTCGTGCTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

GACAGTTCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCCTAATGC Messenger 336672 (GAM336672) oligonucleotides modulates expression of respective target

AGACTTACAA genes whose function and utility is known in the art.

AAACTAGGTG GAM336672 is a novel bioinformatically detectable regulatory, non protein

TAAGGCTGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336672 was detected

ATTAGGGTGA is described with additional reference to Figs. 9-15.

GGCCAGGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AG encoded by the human genome.

GAM336672 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336672 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336672 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336672 precursor RNA is designated SEQ ID:6170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6170 is located from position 36386609 to position 36386690 relative to chromosome 10 on the `-` strand.

GAM336672 precursor RNA folds onto itself, forming GAM336672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336672 precursor RNA, designated SEQ ID NO: 6170, and a schematic representation of a predicted secondary folding of GAM336672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336672 folded precursor RNA yielding a GAM336672 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336672 RNA, hereby incorporated herein.

GAM336672 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336672 target RNA, herein designated GAM TARGET RNA.

GAM336672 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336672 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336672 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336672 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336672 RNA, herein designated GAM RNA, to target binding sites on GAM336672 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336672 target RNA into GAM336672 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336672 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336672 target genes. The mRNA of each one of this plurality of GAM336672 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336672 RNA, herein designated GAM RNA, and which when bound by GAM336672 RNA causes inhibition of translation of the GAM336672 target mRNA into a corresponding GAM336672 target protein.

The mechanism of the translational inhibition exerted by GAM336672 RNA, herein designated GAM RNA, on one or more GAM336672 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336672 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336672 RNA, herein designated GAM RNA, of GAM336672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336672 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336672 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336672 RNA correlate with, and may be deduced from, the identity of the GAM336672 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336673 7091 TGACCCTCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GACCTCACAT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGTTCTGGA Messenger 336673 (GAM336673) oligonucleotides modulates expression of respective target

GCCCATACTC genes whose function and utility is known in the art.

ACCAATCAGC GAM336673 is a novel bioinformatically detectable regulatory, non protein
TTTAGCTTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336673 was detected
GGTCGAGATG is described with additional reference to Figs. 9-15.

AGGTTTCTCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGGGTCTCT encoded by the human genome.

GCAGGGTCA GAM336673 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336673 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336673 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336673 precursor RNA is designated SEQ ID:7091, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7091 is located from position 36425183 to position 36425281 relative to chromosome 21 on the `-` strand.

GAM336673 precursor RNA folds onto itself, forming GAM336673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336673 precursor RNA, designated SEQ ID NO: 7091, and a schematic representation of a predicted secondary folding of GAM336673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336673 folded precursor RNA yielding a GAM336673 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336673 RNA, hereby incorporated herein.

GAM336673 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336673 target RNA, herein designated GAM TARGET RNA.

GAM336673 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336673 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336673 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336673 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336673 RNA, herein designated GAM RNA, to target binding sites on GAM336673 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336673 target RNA into GAM336673 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336673 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336673 target genes. The mRNA of each one of this plurality of GAM336673 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336673 RNA, herein designated GAM RNA, and which when bound by GAM336673 RNA causes inhibition of translation of the GAM336673 target mRNA into a corresponding GAM336673 target protein.

The mechanism of the translational inhibition exerted by GAM336673 RNA, herein designated GAM RNA, on one or more GAM336673 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336673 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336673 RNA, herein designated GAM RNA, of GAM336673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336673 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336673 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336673 RNA correlate with, and may be deduced from, the identity of the GAM336673 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATTCCAGTTC Messenger 336674 (GAM336674) oligonucleotides modulates expression of respective target
TCAGCACAGC genes whose function and utility is known in the art.

GCTTGGCACA GAM336674 is a novel bioinformatically detectable regulatory, non protein
TAGTAGGAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336674 was detected
TCAGGAAGTG is described with additional reference to Figs. 9-15.

TTTATGGGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGAATGGGGT encoded by the human genome.

GATGATGTTG GAM336674 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AGG GAM336674 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336674 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336674 precursor RNA is designated SEQ ID:6128, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6128 is located from position 36639912 to position 36640014 relative to chromosome 22 on the `+` strand.

GAM336674 precursor RNA folds onto itself, forming GAM336674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336674 precursor RNA, designated SEQ ID NO: 6128, and a schematic representation of a predicted secondary folding of GAM336674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336674 folded precursor RNA yielding a GAM336674 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336674 RNA, hereby incorporated herein.

GAM336674 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336674 target RNA, herein designated GAM TARGET RNA.

GAM336674 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336674 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336674 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336674 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336674 RNA, herein designated GAM RNA, to target binding sites on GAM336674 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336674 target RNA into GAM336674 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336674 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336674 target genes. The mRNA of each one of this plurality of GAM336674 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336674 RNA, herein designated GAM RNA, and which when bound by GAM336674 RNA causes inhibition of translation of the GAM336674 target mRNA into a corresponding GAM336674 target protein.

The mechanism of the translational inhibition exerted by GAM336674 RNA, herein designated GAM RNA, on one or more GAM336674 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336674 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336674 RNA, herein designated GAM RNA, of GAM336674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336674 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336674 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336674 RNA correlate with, and may be deduced from, the identity of the GAM336674 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336675 6339 GAGACAGGAG AATCACTTGA ATCTGAGAGG TGGAAGTTGC AGTGAGCCGA GATTGTGCCA CTGCACTCCA GCCTGGGTGA CAGAGTGAAA CTCCATCTC

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336675 (GAM336675) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336675 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336675 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336675 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336675 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336675 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336675 precursor RNA is designated SEQ ID:6339, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6339 is located from position 36669197 to position 36669295 relative to chromosome 9 on the `+` strand.

GAM336675 precursor RNA folds onto itself, forming GAM336675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336675 precursor RNA, designated SEQ ID NO: 6339, and a schematic representation of a predicted secondary folding of GAM336675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336675 folded precursor RNA yielding a GAM336675 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336675 RNA, hereby incorporated herein.

GAM336675 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336675 target RNA, herein designated GAM TARGET RNA.

GAM336675 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336675 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336675 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336675 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336675 RNA, herein designated GAM RNA, to target binding sites on GAM336675 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336675 target RNA into GAM336675 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336675 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336675 target genes. The mRNA of each one of this plurality of GAM336675 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336675 RNA, herein designated GAM RNA, and which when bound by GAM336675 RNA causes inhibition of translation of the GAM336675 target mRNA into a corresponding GAM336675 target protein.

The mechanism of the translational inhibition exerted by GAM336675 RNA, herein designated GAM RNA, on one or more GAM336675 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336675 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336675 RNA, herein designated GAM RNA, of

GAM336675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336675 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336675 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336675 RNA correlate with, and may be deduced from, the identity of the GAM336675 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336676 7229 TGGCTTCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGTGCTGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTACAGGTG Messenger 336676 (GAM336676) oligonucleotides modulates expression of respective target

TGAGCCACCG genes whose function and utility is known in the art.

CACCTGGCCA GAM336676 is a novel bioinformatically detectable regulatory, non protein

TCCCGGCATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336676 was detected

TTTCTATTCT is described with additional reference to Figs. 9-15.

GCTGTGAGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TA encoded by the human genome.

GAM336676 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336676 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336676 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336676 precursor RNA is designated SEQ ID:7229, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7229 is located from position 36951386 to position 36951467 relative to chromosome 22 on the `+` strand.

GAM336676 precursor RNA folds onto itself, forming GAM336676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336676 precursor RNA, designated SEQ ID NO: 7229, and

a schematic representation of a predicted secondary folding of GAM336676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336676 folded precursor RNA yielding a GAM336676 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336676 RNA, hereby incorporated herein.

GAM336676 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336676 target RNA, herein designated GAM TARGET RNA.

GAM336676 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336676 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336676 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336676 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336676 RNA, herein designated GAM RNA, to target binding sites on GAM336676 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336676 target RNA into GAM336676 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336676 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336676 target genes. The mRNA of each one of this plurality of GAM336676 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336676 RNA, herein designated GAM RNA, and which when bound by GAM336676 RNA causes inhibition of translation of the GAM336676 target mRNA into a corresponding GAM336676 target protein.

The mechanism of the translational inhibition exerted by GAM336676 RNA, herein designated GAM RNA, on one or more GAM336676 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336676 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336676 RNA, herein designated GAM RNA, of GAM336676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336676 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336676 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336676 RNA correlate with, and may be deduced from, the identity of the GAM336676 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336677 6989 TCAATACTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAGGCACAC detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGTCTGCTT Messenger 336677 (GAM336677) oligonucleotides modulates expression of respective target

TCTACACTGT genes whose function and utility is known in the art.

TGCCGGAGAA GAM336677 is a novel bioinformatically detectable regulatory, non protein

GGGTCATAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336677 was detected

GTGAAGTTTG is described with additional reference to Figs. 9-15.

GCAGAAAAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGGCCATTG encoded by the human genome.

TCTAGTACTG GAM336677 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336677 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336677 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336677 precursor RNA is designated SEQ ID:6989, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6989 is located from position 36970296 to position 36970396 relative to chromosome 17 on the `+` strand.

GAM336677 precursor RNA folds onto itself, forming GAM336677 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336677 precursor RNA, designated SEQ ID NO: 6989, and a schematic representation of a predicted secondary folding of GAM336677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336677 folded precursor RNA yielding a GAM336677 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336677 RNA, hereby incorporated herein.

GAM336677 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336677 target RNA, herein designated GAM TARGET RNA.

GAM336677 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336677 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336677 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336677 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336677 RNA, herein designated GAM RNA, to target binding sites on GAM336677 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336677 target RNA into GAM336677 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336677 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336677 target genes. The mRNA of each one of this plurality of GAM336677 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336677 RNA,

herein designated GAM RNA, and which when bound by GAM336677 RNA causes inhibition of translation of the GAM336677 target mRNA into a corresponding GAM336677 target protein.

The mechanism of the translational inhibition exerted by GAM336677 RNA, herein designated GAM RNA, on one or more GAM336677 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336677 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336677 RNA, herein designated GAM RNA, of GAM336677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336677 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336677 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336677 RNA correlate with, and may be deduced from, the identity of the GAM336677 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336681 5716 AGAATCGCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAACCCAGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCACAGGTT Messenger 336681 (GAM336681) oligonucleotides modulates expression of respective target

GCAGTAGGCC genes whose function and utility is known in the art.

GAGATTGTGC GAM336681 is a novel bioinformatically detectable regulatory, non protein

CACTGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336681 was detected

CAGCCTGGGT is described with additional reference to Figs. 9-15.

GGCAGAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACT encoded by the human genome.

GAM336681 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336681 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336681 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336681 precursor RNA is designated SEQ ID:5716, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5716 is located from position 37422585 to position 37422668 relative to chromosome 9 on the `+` strand.

GAM336681 precursor RNA folds onto itself, forming GAM336681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336681 precursor RNA, designated SEQ ID NO: 5716, and a schematic representation of a predicted secondary folding of GAM336681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336681 folded precursor RNA yielding a GAM336681 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336681 RNA, hereby incorporated herein.

GAM336681 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336681 target RNA, herein designated GAM TARGET RNA.

GAM336681 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336681 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336681 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336681 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336681 RNA, herein designated GAM RNA, to target binding sites on GAM336681 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336681 target RNA

into GAM336681 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336681 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336681 target genes. The mRNA of each one of this plurality of GAM336681 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336681 RNA, herein designated GAM RNA, and which when bound by GAM336681 RNA causes inhibition of translation of the GAM336681 target mRNA into a corresponding GAM336681 target protein.

The mechanism of the translational inhibition exerted by GAM336681 RNA, herein designated GAM RNA, on one or more GAM336681 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336681 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336681 RNA, herein designated GAM RNA, of GAM336681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336681 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336681 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336681 RNA correlate with, and may be deduced from, the identity of the GAM336681 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336683 7156 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATGGCGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 336683 (GAM336683) oligonucleotides modulates expression of respective target

GCGGAGCTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336683 is a novel bioinformatically detectable regulatory, non protein

AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336683 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGTGAG encoded by the human genome.

ACTCCGTCTC GAM336683 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336683 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336683 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336683 precursor RNA is designated SEQ ID:7156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7156 is located from position 37445099 to position 37445199 relative to chromosome 21 on the `-` strand.

GAM336683 precursor RNA folds onto itself, forming GAM336683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336683 precursor RNA, designated SEQ ID NO: 7156, and a schematic representation of a predicted secondary folding of GAM336683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336683 folded precursor RNA yielding a GAM336683 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336683 RNA, hereby incorporated herein. Expression of GAM336683 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336683 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336683 target RNA, herein designated GAM TARGET RNA.

GAM336683 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336683 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336683 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336683 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336683 RNA, herein designated GAM RNA, to target binding sites on GAM336683 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336683 target RNA into GAM336683 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336683 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336683 target genes. The mRNA of each one of this plurality of GAM336683 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336683 RNA, herein designated GAM RNA, and which when bound by GAM336683 RNA causes inhibition of translation of the GAM336683 target mRNA into a corresponding GAM336683 target protein.

The mechanism of the translational inhibition exerted by GAM336683 RNA, herein designated GAM RNA, on one or more GAM336683 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336683 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336683 RNA, herein designated GAM RNA, of GAM336683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336683 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336683 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336683 RNA correlate with, and may be deduced from, the identity of the GAM336683 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGAGCAGCTA encoded by the human genome.

GCAAGGGCGG GAM336685 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AAGGAAGAGA GAM336685 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAGA GAM336685 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336685 precursor RNA is designated SEQ ID:7081, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7081 is located from position 37606073 to position 37606186 relative to chromosome 20 on the `+` strand.

GAM336685 precursor RNA folds onto itself, forming GAM336685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336685 precursor RNA, designated SEQ ID NO: 7081, and a schematic representation of a predicted secondary folding of GAM336685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336685 folded precursor RNA yielding a GAM336685 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336685 RNA, hereby incorporated herein.

GAM336685 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336685 target RNA, herein designated GAM TARGET RNA.

GAM336685 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336685 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336685 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336685 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336685 RNA, herein designated GAM RNA, to target binding sites on GAM336685 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336685 target RNA into GAM336685 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336685 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336685 target genes. The mRNA of each one of this plurality of GAM336685 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336685 RNA, herein designated GAM RNA, and which when bound by GAM336685 RNA causes inhibition of translation of the GAM336685 target mRNA into a corresponding GAM336685 target protein.

The mechanism of the translational inhibition exerted by GAM336685 RNA, herein designated GAM RNA, on one or more GAM336685 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336685 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336685 RNA, herein designated GAM RNA, of GAM336685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336685 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336685 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336685 RNA correlate with, and may be deduced from, the identity of the GAM336685 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336686 7142 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCGGAAG Messenger 336686 (GAM336686) oligonucleotides modulates expression of respective target
GCAGAGGTTG genes whose function and utility is known in the art.

TGGTGAGCTG GAM336686 is a novel bioinformatically detectable regulatory, non protein
AGATTGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336686 was detected
ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATAAGAGCAA encoded by the human genome.

AACTCTGTCT GAM336686 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM336686 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336686 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336686 precursor RNA is designated SEQ ID:7142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7142 is located from position 37624000 to position 37624101 relative to chromosome 3 on the `+` strand.

GAM336686 precursor RNA folds onto itself, forming GAM336686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336686 precursor RNA, designated SEQ ID NO: 7142, and a schematic representation of a predicted secondary folding of GAM336686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336686 folded precursor RNA yielding a GAM336686 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336686 RNA, hereby incorporated herein. Expression of GAM336686 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336686 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336686 target RNA, herein designated GAM TARGET RNA.

GAM336686 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336686 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336686 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336686 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336686 RNA, herein designated GAM RNA, to target binding sites on GAM336686 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336686 target RNA into GAM336686 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336686 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336686 target genes. The mRNA of each one of this plurality of GAM336686 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336686 RNA, herein designated GAM RNA, and which when bound by GAM336686 RNA causes inhibition of translation of the GAM336686 target mRNA into a corresponding GAM336686 target protein.

The mechanism of the translational inhibition exerted by GAM336686 RNA, herein designated GAM RNA, on one or more GAM336686 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336686 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336686 RNA, herein designated GAM RNA, of

GAM336686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336686 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336686 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336686 RNA correlate with, and may be deduced from, the identity of the GAM336686 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336689 6246 CTGTTGCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCTGGAGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGTGGCACC Messenger 336689 (GAM336689) oligonucleotides modulates expression of respective target

ATCTCAGCTC genes whose function and utility is known in the art.

ACTGGAGCGT GAM336689 is a novel bioinformatically detectable regulatory, non protein

CTGCCTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336689 was detected

GTTCAAGTGA is described with additional reference to Figs. 9-15.

TTCTCCTGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCAGCATCCC encoded by the human genome.

AAGTAGCTGG GAM336689 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GACTACAG GAM336689 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336689 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336689 precursor RNA is designated SEQ ID:6246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6246 is located from position 37948104 to position 37948211 relative to chromosome 7 on the `+` strand.

GAM336689 precursor RNA folds onto itself, forming GAM336689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336689 precursor RNA, designated SEQ ID NO: 6246, and a schematic representation of a predicted secondary folding of GAM336689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336689 folded precursor RNA yielding a GAM336689 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336689 RNA, hereby incorporated herein.

GAM336689 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336689 target RNA, herein designated GAM TARGET RNA.

GAM336689 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336689 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336689 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336689 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336689 RNA, herein designated GAM RNA, to target binding sites on GAM336689 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336689 target RNA into GAM336689 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336689 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336689 target genes. The mRNA of each one of this plurality of GAM336689 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336689 RNA, herein designated GAM RNA, and which when bound by GAM336689 RNA causes inhibition of translation of the GAM336689 target mRNA into a corresponding GAM336689 target protein.

The mechanism of the translational inhibition exerted by GAM336689 RNA, herein designated GAM RNA, on one or more GAM336689 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336689 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336689 RNA, herein designated GAM RNA, of GAM336689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336689 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336689 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336689 RNA correlate with, and may be deduced from, the identity of the GAM336689 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336690 7092 TGAGAAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTCATTCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGCCTAGGC Messenger 336690 (GAM336690) oligonucleotides modulates expression of respective target

CGGAGTGCAG genes whose function and utility is known in the art.

TGACATGATC GAM336690 is a novel bioinformatically detectable regulatory, non protein

TTGGCTCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336690 was detected

GCAATCTCCA is described with additional reference to Figs. 9-15.

CCTCCAGGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGTGATTC encoded by the human genome.

TCCTGCCTCA GAM336690 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336690 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336690 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336690 precursor RNA is designated SEQ ID:7092, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7092 is located from position 37983831 to position 37983930 relative to chromosome 7 on the `-` strand.

GAM336690 precursor RNA folds onto itself, forming GAM336690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336690 precursor RNA, designated SEQ ID NO: 7092, and a schematic representation of a predicted secondary folding of GAM336690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336690 folded precursor RNA yielding a GAM336690 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336690 RNA, hereby incorporated herein.

GAM336690 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336690 target RNA, herein designated GAM TARGET RNA.

GAM336690 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336690 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336690 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336690 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336690 RNA, herein designated GAM RNA, to target binding sites on GAM336690 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336690 target RNA into GAM336690 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336690 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336690 target genes. The mRNA of each one of this plurality of GAM336690 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM336690 RNA, herein designated GAM RNA, and which when bound by GAM336690 RNA causes inhibition of translation of the GAM336690 target mRNA into a corresponding GAM336690 target protein.

The mechanism of the translational inhibition exerted by GAM336690 RNA, herein designated GAM RNA, on one or more GAM336690 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336690 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336690 RNA, herein designated GAM RNA, of GAM336690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336690 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336690 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336690 RNA correlate with, and may be deduced from, the identity of the GAM336690 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336691 6926 GTGTGACTTT Fig. 8 further provides a conceptual description of another novel bioinformatically
AGTGCTACTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGATTTTACT Messenger 336691 (GAM336691) oligonucleotides modulates expression of respective target
GTTCAGGAAA genes whose function and utility is known in the art.

GTGAAGCAGA GAM336691 is a novel bioinformatically detectable regulatory, non protein
GAGGTTCAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336691 was detected
GTCTTACTCA is described with additional reference to Figs. 9-15.

AGGTCACAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336691 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336691 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336691 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336691 precursor RNA is designated SEQ ID:6926, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6926 is located from position 38081171 to position 38081249 relative to chromosome 20 on the `+` strand.

GAM336691 precursor RNA folds onto itself, forming GAM336691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336691 precursor RNA, designated SEQ ID NO: 6926, and a schematic representation of a predicted secondary folding of GAM336691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336691 folded precursor RNA yielding a GAM336691 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336691 RNA, hereby incorporated herein.

GAM336691 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336691 target RNA, herein designated GAM TARGET RNA.

GAM336691 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336691 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336691 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336691 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336691 RNA, herein designated GAM RNA, to target binding sites on GAM336691 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336691 target RNA

into GAM336691 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336691 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336691 target genes. The mRNA of each one of this plurality of GAM336691 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336691 RNA, herein designated GAM RNA, and which when bound by GAM336691 RNA causes inhibition of translation of the GAM336691 target mRNA into a corresponding GAM336691 target protein.

The mechanism of the translational inhibition exerted by GAM336691 RNA, herein designated GAM RNA, on one or more GAM336691 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336691 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336691 RNA, herein designated GAM RNA, of GAM336691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336691 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336691 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336691 RNA correlate with, and may be deduced from, the identity of the GAM336691 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336697 7005 TCACTTGAGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAGGAGTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCTGCAG Messenger 336697 (GAM336697) oligonucleotides modulates expression of respective target

TGAGCTATGA genes whose function and utility is known in the art.

TTGCACCACT GAM336697 is a novel bioinformatically detectable regulatory, non protein

GTACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336697 was detected

CTGGGTGACA is described with additional reference to Figs. 9-15.

GAGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336697 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336697 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336697 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336697 precursor RNA is designated SEQ ID:7005, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7005 is located from position 38541864 to position 38541939 relative to chromosome 8 on the `+` strand.

GAM336697 precursor RNA folds onto itself, forming GAM336697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336697 precursor RNA, designated SEQ ID NO: 7005, and a schematic representation of a predicted secondary folding of GAM336697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336697 folded precursor RNA yielding a GAM336697 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336697 RNA, hereby incorporated herein.

GAM336697 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336697 target RNA, herein designated GAM TARGET RNA.

GAM336697 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336697 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336697 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336697 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336697 RNA, herein designated GAM RNA, to target binding sites on GAM336697 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336697 target RNA into GAM336697 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336697 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336697 target genes. The mRNA of each one of this plurality of GAM336697 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336697 RNA, herein designated GAM RNA, and which when bound by GAM336697 RNA causes inhibition of translation of the GAM336697 target mRNA into a corresponding GAM336697 target protein.

The mechanism of the translational inhibition exerted by GAM336697 RNA, herein designated GAM RNA, on one or more GAM336697 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336697 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336697 RNA, herein designated GAM RNA, of GAM336697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336697 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336697 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336697 RNA correlate with, and may be deduced from, the identity of the GAM336697 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336699 6107 CCTATCACAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCTGCCAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCCTCTGGT Messenger 336699 (GAM336699) oligonucleotides modulates expression of respective target

AAACTGCAGG genes whose function and utility is known in the art.

TTCCCTCTGC GAM336699 is a novel bioinformatically detectable regulatory, non protein
CTCAGTTGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336699 was detected
GCCAGGGATT is described with additional reference to Figs. 9-15.

CTGACCAGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATGATGGG encoded by the human genome.

GAM336699 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336699 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336699 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336699 precursor RNA is designated SEQ ID:6107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6107 is located from position 38679676 to position 38679764 relative to chromosome 15 on the `+` strand.

GAM336699 precursor RNA folds onto itself, forming GAM336699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336699 precursor RNA, designated SEQ ID NO: 6107, and a schematic representation of a predicted secondary folding of GAM336699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336699 folded precursor RNA yielding a GAM336699 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336699 RNA, hereby incorporated herein.

GAM336699 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336699 target RNA, herein designated GAM TARGET RNA.

GAM336699 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336699 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336699 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336699 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336699 RNA, herein designated GAM RNA, to target binding sites on GAM336699 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336699 target RNA into GAM336699 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336699 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336699 target genes. The mRNA of each one of this plurality of GAM336699 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336699 RNA, herein designated GAM RNA, and which when bound by GAM336699 RNA causes inhibition of translation of the GAM336699 target mRNA into a corresponding GAM336699 target protein.

The mechanism of the translational inhibition exerted by GAM336699 RNA, herein designated GAM RNA, on one or more GAM336699 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336699 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336699 RNA, herein designated GAM RNA, of GAM336699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336699 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336699 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336699 RNA correlate with, and may be deduced from, the identity of the GAM336699 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336701 6936 GTTACTTCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
CAAGTAGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
ATGGATATTT Messenger 336701 (GAM336701) oligonucleotides modulates expression of respective target
TTGATGCCCA genes whose function and utility is known in the art.

GAGTGTTGTC GAM336701 is a novel bioinformatically detectable regulatory, non protein
TTCCCCGTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336701 was detected
AGGGTATCTC is described with additional reference to Figs. 9-15.

ATTCTGATCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACCGAATTG encoded by the human genome.

GCCATCCATA GAM336701 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CTGAGAAGTG GAM336701 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GC GAM336701 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336701 precursor RNA is designated SEQ ID:6936, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6936 is located from position 38828150 to position 38828261 relative to chromosome 22 on the `+` strand.

GAM336701 precursor RNA folds onto itself, forming GAM336701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336701 precursor RNA, designated SEQ ID NO: 6936, and a schematic representation of a predicted secondary folding of GAM336701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336701 folded precursor RNA yielding a GAM336701 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336701 RNA, hereby incorporated herein.

GAM336701 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336701 target RNA, herein designated GAM TARGET RNA.

GAM336701 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336701 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336701 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336701 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336701 RNA, herein designated GAM RNA, to target binding sites on GAM336701 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336701 target RNA into GAM336701 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336701 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336701 target genes. The mRNA of each one of this plurality of GAM336701 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336701 RNA, herein designated GAM RNA, and which when bound by GAM336701 RNA causes inhibition of translation of the GAM336701 target mRNA into a corresponding GAM336701 target protein.

The mechanism of the translational inhibition exerted by GAM336701 RNA, herein designated GAM RNA, on one or more GAM336701 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336701 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336701 RNA, herein designated GAM RNA, of GAM336701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336701 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336701 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336701 RNA correlate with, and may be deduced from, the identity of the GAM336701 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAACATGCAG Messenger 336702 (GAM336702) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336702 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336702 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336702 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336702 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336702 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336702 precursor RNA is designated SEQ ID:5861, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5861 is located from position 38853404 to position 38853485 relative to chromosome 6 on the `+` strand.

GAM336702 precursor RNA folds onto itself, forming GAM336702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336702 precursor RNA, designated SEQ ID NO: 5861, and a schematic representation of a predicted secondary folding of GAM336702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336702 folded precursor RNA yielding a GAM336702 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336702 RNA, hereby incorporated herein.

GAM336702 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336702 target RNA, herein designated GAM TARGET RNA.

GAM336702 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336702 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336702 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336702 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336702 RNA, herein designated GAM RNA, to target binding sites on GAM336702 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336702 target RNA into GAM336702 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336702 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336702 target genes. The mRNA of each one of this plurality of GAM336702 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336702 RNA, herein designated GAM RNA, and which when bound by GAM336702 RNA causes inhibition of translation of the GAM336702 target mRNA into a corresponding GAM336702 target protein.

The mechanism of the translational inhibition exerted by GAM336702 RNA, herein designated GAM RNA, on one or more GAM336702 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336702 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336702 RNA, herein designated GAM RNA, of GAM336702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336702 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336702 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336702 RNA correlate with, and may be deduced from, the identity of the GAM336702 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAGCCCAGGT detected oligonucleotides of the present invention, referred to here as Genomic Address

AGTTGAGACT Messenger 336703 (GAM336703) oligonucleotides modulates expression of respective target

GCAGTGAACC genes whose function and utility is known in the art.

ATGATTGTGC GAM336703 is a novel bioinformatically detectable regulatory, non protein

CACTGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336703 was detected

AGCCTGGGTG is described with additional reference to Figs. 9-15.

ACAGTTAAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCCTGTCTC encoded by the human genome.

GAM336703 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336703 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336703 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336703 precursor RNA is designated SEQ ID:6358, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6358 is located from position 39141230 to position 39141318 relative to chromosome 21 on the `-` strand.

GAM336703 precursor RNA folds onto itself, forming GAM336703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336703 precursor RNA, designated SEQ ID NO: 6358, and a schematic representation of a predicted secondary folding of GAM336703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336703 folded precursor RNA yielding a GAM336703 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336703 RNA, hereby incorporated herein.

GAM336703 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336703 target RNA, herein designated GAM TARGET RNA.

GAM336703 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336703 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336703 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336703 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336703 RNA, herein designated GAM RNA, to target binding sites on GAM336703 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336703 target RNA into GAM336703 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336703 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336703 target genes. The mRNA of each one of this plurality of GAM336703 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336703 RNA, herein designated GAM RNA, and which when bound by GAM336703 RNA causes inhibition of translation of the GAM336703 target mRNA into a corresponding GAM336703 target protein.

The mechanism of the translational inhibition exerted by GAM336703 RNA, herein designated GAM RNA, on one or more GAM336703 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336703 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336703 RNA, herein designated GAM RNA, of GAM336703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336703 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336703 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336703 RNA correlate with, and may be deduced from, the identity of the GAM336703 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336704 6697 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACGCCG detected oligonucleotides of the present invention, referred to here as Genomic Address

GGGTCGGAGG Messenger 336704 (GAM336704) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCATGATCGC GAM336704 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336704 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCT encoded by the human genome.

GAM336704 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336704 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336704 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336704 precursor RNA is designated SEQ ID:6697, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6697 is located from position 39394031 to position 39394118 relative to chromosome 1 on the `+` strand.

GAM336704 precursor RNA folds onto itself, forming GAM336704 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336704 precursor RNA, designated SEQ ID NO: 6697, and a schematic representation of a predicted secondary folding of GAM336704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336704 folded precursor RNA yielding a GAM336704 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336704 RNA, hereby incorporated herein. Expression of GAM336704 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336704 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336704 target RNA, herein designated GAM TARGET RNA.

GAM336704 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336704 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336704 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336704 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336704 RNA, herein designated GAM RNA, to target binding sites on GAM336704 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336704 target RNA into GAM336704 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336704 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336704 target genes. The mRNA of each one of this

plurality of GAM336704 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336704 RNA, herein designated GAM RNA, and which when bound by GAM336704 RNA causes inhibition of translation of the GAM336704 target mRNA into a corresponding GAM336704 target protein.

The mechanism of the translational inhibition exerted by GAM336704 RNA, herein designated GAM RNA, on one or more GAM336704 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336704 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336704 RNA, herein designated GAM RNA, of GAM336704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336704 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336704 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336704 RNA correlate with, and may be deduced from, the identity of the GAM336704 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336705 6334 GAGAATTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACGCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTCGGAGGT Messenger 336705 (GAM336705) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CATGATCGCG GAM336705 is a novel bioinformatically detectable regulatory, non protein

CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336705 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAGCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGACTC encoded by the human genome.

GAM336705 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336705 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336705 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336705 precursor RNA is designated SEQ ID:6334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6334 is located from position 39394032 to position 39394117 relative to chromosome 1 on the `+` strand.

GAM336705 precursor RNA folds onto itself, forming GAM336705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336705 precursor RNA, designated SEQ ID NO: 6334, and a schematic representation of a predicted secondary folding of GAM336705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336705 folded precursor RNA yielding a GAM336705 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336705 RNA, hereby incorporated herein. Expression of GAM336705 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336705 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336705 target RNA, herein designated GAM TARGET RNA.

GAM336705 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336705 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336705 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336705 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336705 RNA, herein designated GAM RNA, to target binding sites on GAM336705 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336705 target RNA into GAM336705 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336705 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336705 target genes. The mRNA of each one of this plurality of GAM336705 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336705 RNA, herein designated GAM RNA, and which when bound by GAM336705 RNA causes inhibition of translation of the GAM336705 target mRNA into a corresponding GAM336705 target protein.

The mechanism of the translational inhibition exerted by GAM336705 RNA, herein designated GAM RNA, on one or more GAM336705 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336705 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336705 RNA, herein designated GAM RNA, of GAM336705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336705 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336705 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336705 RNA correlate with, and may be deduced from, the identity of the GAM336705 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336706 6372 GAGGCAGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCCAGTGAT detected oligonucleotides of the present invention, referred to here as Genomic Address

TCATTTGGTT Messenger 336706 (GAM336706) oligonucleotides modulates expression of respective target

GTTCATTTTG genes whose function and utility is known in the art.

TTGGGACTGA GAM336706 is a novel bioinformatically detectable regulatory, non protein

GAACAGCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336706 was detected

ATGACTGGAT is described with additional reference to Figs. 9-15.

CCACACTGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TC encoded by the human genome.

GAM336706 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336706 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336706 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336706 precursor RNA is designated SEQ ID:6372, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6372 is located from position 39568547 to position 39568628 relative to chromosome X on the `+` strand.

GAM336706 precursor RNA folds onto itself, forming GAM336706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336706 precursor RNA, designated SEQ ID NO: 6372, and a schematic representation of a predicted secondary folding of GAM336706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336706 folded precursor RNA yielding a GAM336706 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336706 RNA, hereby incorporated herein.

GAM336706 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336706 target RNA, herein designated GAM TARGET RNA.

GAM336706 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336706 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336706 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336706 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336706 RNA, herein designated GAM RNA, to target binding sites on GAM336706 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336706 target RNA into GAM336706 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336706 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336706 target genes. The mRNA of each one of this plurality of GAM336706 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336706 RNA, herein designated GAM RNA, and which when bound by GAM336706 RNA causes inhibition of translation of the GAM336706 target mRNA into a corresponding GAM336706 target protein.

The mechanism of the translational inhibition exerted by GAM336706 RNA, herein designated GAM RNA, on one or more GAM336706 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336706 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336706 RNA, herein designated GAM RNA, of GAM336706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336706 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336706 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336706 RNA correlate with, and may be deduced from, the identity of the GAM336706 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336707 6510 GCCGTAGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGTGTGGCA Messenger 336707 (GAM336707) oligonucleotides modulates expression of respective target
GAAGGCTCTG genes whose function and utility is known in the art.

GATTAGTCCT GAM336707 is a novel bioinformatically detectable regulatory, non protein
GGGTTCTAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336707 was detected
TCTGGGTCTT is described with additional reference to Figs. 9-15.

CTACAAACCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTCCATGAA encoded by the human genome.

TTAGGC GAM336707 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336707 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336707 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336707 precursor RNA is designated SEQ ID:6510, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6510 is located from position 39605027 to position 39605122 relative to chromosome 22 on the `+` strand.

GAM336707 precursor RNA folds onto itself, forming GAM336707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336707 precursor RNA, designated SEQ ID NO: 6510, and a schematic representation of a predicted secondary folding of GAM336707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336707 folded precursor RNA yielding a GAM336707 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336707 RNA, hereby incorporated herein.

GAM336707 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336707 target RNA, herein designated GAM TARGET RNA.

GAM336707 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336707 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336707 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336707 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336707 RNA, herein designated GAM RNA, to target binding sites on GAM336707 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336707 target RNA into GAM336707 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336707 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336707 target genes. The mRNA of each one of this plurality of GAM336707 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336707 RNA, herein designated GAM RNA, and which when bound by GAM336707 RNA causes inhibition of translation of the GAM336707 target mRNA into a corresponding GAM336707 target protein.

The mechanism of the translational inhibition exerted by GAM336707 RNA, herein designated GAM RNA, on one or more GAM336707 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336707 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336707 RNA, herein designated GAM RNA, of GAM336707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336707 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336707 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336707 RNA correlate with, and may be deduced from, the identity of the GAM336707 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GATTGTGGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336709 was detected
CAGCAGTCCA is described with additional reference to Figs. 9-15.

GCCTGGGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CACAAGGATA encoded by the human genome.

CCCTGTCTT GAM336709 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336709 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336709 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336709 precursor RNA is designated SEQ ID:6353, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6353 is located from position 39769473 to position 39769571 relative to chromosome 22 on the `+` strand.

GAM336709 precursor RNA folds onto itself, forming GAM336709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336709 precursor RNA, designated SEQ ID NO: 6353, and a schematic representation of a predicted secondary folding of GAM336709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336709 folded precursor RNA yielding a GAM336709 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336709 RNA, hereby incorporated herein.

GAM336709 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336709 target RNA, herein designated GAM TARGET RNA.

GAM336709 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336709 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336709 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336709 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336709 RNA, herein designated GAM RNA, to target binding sites on GAM336709 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336709 target RNA into GAM336709 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336709 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336709 target genes. The mRNA of each one of this plurality of GAM336709 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336709 RNA, herein designated GAM RNA, and which when bound by GAM336709 RNA causes inhibition of translation of the GAM336709 target mRNA into a corresponding GAM336709 target protein.

The mechanism of the translational inhibition exerted by GAM336709 RNA, herein designated GAM RNA, on one or more GAM336709 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336709 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336709 RNA, herein designated GAM RNA, of GAM336709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336709 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336709 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336709 RNA correlate with, and may be deduced from, the identity of the GAM336709 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTTAGAGTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336710 was detected
CAAAAAAATA is described with additional reference to Figs. 9-15.

GAGCAGAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTCTGCTGT encoded by the human genome.

CTCCAG GAM336710 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336710 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336710 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336710 precursor RNA is designated SEQ ID:6224, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6224 is located from position 39771457 to position 39771552 relative to chromosome 15 on the `-` strand.

GAM336710 precursor RNA folds onto itself, forming GAM336710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336710 precursor RNA, designated SEQ ID NO: 6224, and a schematic representation of a predicted secondary folding of GAM336710 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336710 folded precursor RNA yielding a GAM336710 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336710 RNA, hereby incorporated herein.

GAM336710 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336710 target RNA, herein designated GAM TARGET RNA.

GAM336710 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336710 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336710 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336710 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336710 RNA, herein designated GAM RNA, to target binding sites on GAM336710 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336710 target RNA into GAM336710 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336710 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336710 target genes. The mRNA of each one of this plurality of GAM336710 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336710 RNA, herein designated GAM RNA, and which when bound by GAM336710 RNA causes inhibition of translation of the GAM336710 target mRNA into a corresponding GAM336710 target protein.

The mechanism of the translational inhibition exerted by GAM336710 RNA, herein designated GAM RNA, on one or more GAM336710 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336710 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336710 RNA, herein designated GAM RNA, of GAM336710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336710 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336710 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336710 RNA correlate with, and may be deduced from, the identity of the GAM336710 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336713 6084 CCCTACTATT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCTTGGGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACATCCAGCA Messenger 336713 (GAM336713) oligonucleotides modulates expression of respective target

CATACTCAAG genes whose function and utility is known in the art.

GTGGGAGGGC GAM336713 is a novel bioinformatically detectable regulatory, non protein

AGTAAGCTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336713 was detected

ATGGTGGCTA is described with additional reference to Figs. 9-15.

GATGTTTCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGACAAGAG encoded by the human genome.

TAGGG GAM336713 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336713 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336713 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336713 precursor RNA is designated SEQ ID:6084, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6084 is located from position 39876405 to position 39876499 relative to chromosome 19 on the `-` strand.

GAM336713 precursor RNA folds onto itself, forming GAM336713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336713 precursor RNA, designated SEQ ID NO: 6084, and a schematic representation of a predicted secondary folding of GAM336713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336713 folded precursor RNA yielding a GAM336713 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336713 RNA, hereby incorporated herein.

GAM336713 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336713 target RNA, herein designated GAM TARGET RNA.

GAM336713 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336713 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336713 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336713 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336713 RNA, herein designated GAM RNA, to target binding sites on GAM336713 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336713 target RNA into GAM336713 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336713 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336713 target genes. The mRNA of each one of this plurality of GAM336713 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336713 RNA, herein designated GAM RNA, and which when bound by GAM336713 RNA causes inhibition of translation of the GAM336713 target mRNA into a corresponding GAM336713 target protein.

The mechanism of the translational inhibition exerted by GAM336713 RNA, herein designated GAM RNA, on one or more GAM336713 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336713 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336713 RNA, herein designated GAM RNA, of GAM336713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336713 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336713 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336713 RNA correlate with, and may be deduced from, the identity of the GAM336713 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336715 6326 GAGAATCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCAGAGGT Messenger 336715 (GAM336715) oligonucleotides modulates expression of respective target

GGTGGTGAGT genes whose function and utility is known in the art.

CGAGATAGCA GAM336715 is a novel bioinformatically detectable regulatory, non protein

CCATTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336715 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAAACTC encoded by the human genome.

GAM336715 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336715 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336715 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336715 precursor RNA is designated SEQ

ID:6326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6326 is located from position 39935490 to position 39935576 relative to chromosome X on the `+` strand.

GAM336715 precursor RNA folds onto itself, forming GAM336715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336715 precursor RNA, designated SEQ ID NO: 6326, and a schematic representation of a predicted secondary folding of GAM336715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336715 folded precursor RNA yielding a GAM336715 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336715 RNA, hereby incorporated herein. Expression of GAM336715 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336715 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336715 target RNA, herein designated GAM TARGET RNA.

GAM336715 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336715 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336715 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336715 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336715 RNA, herein designated GAM RNA, to target binding sites on GAM336715 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336715 target RNA

into GAM336715 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336715 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336715 target genes. The mRNA of each one of this plurality of GAM336715 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336715 RNA, herein designated GAM RNA, and which when bound by GAM336715 RNA causes inhibition of translation of the GAM336715 target mRNA into a corresponding GAM336715 target protein.

The mechanism of the translational inhibition exerted by GAM336715 RNA, herein designated GAM RNA, on one or more GAM336715 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336715 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336715 RNA, herein designated GAM RNA, of GAM336715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336715 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336715 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336715 RNA correlate with, and may be deduced from, the identity of the GAM336715 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336716 6606 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGACGGAGT Messenger 336716 (GAM336716) oligonucleotides modulates expression of respective target

TTGTGGTGAG genes whose function and utility is known in the art.

CCGAGATCAC GAM336716 is a novel bioinformatically detectable regulatory, non protein

ACCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336716 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAACAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAAACTCC encoded by the human genome.

GAM336716 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336716 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336716 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336716 precursor RNA is designated SEQ ID:6606, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6606 is located from position 40002861 to position 40002949 relative to chromosome 4 on the `+` strand.

GAM336716 precursor RNA folds onto itself, forming GAM336716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336716 precursor RNA, designated SEQ ID NO: 6606, and a schematic representation of a predicted secondary folding of GAM336716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336716 folded precursor RNA yielding a GAM336716 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336716 RNA, hereby incorporated herein. Expression of GAM336716 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336716 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336716 target RNA, herein designated GAM TARGET RNA.

GAM336716 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336716 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336716 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336716 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336716 RNA, herein designated GAM RNA, to target binding sites on GAM336716 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336716 target RNA into GAM336716 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336716 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336716 target genes. The mRNA of each one of this plurality of GAM336716 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336716 RNA, herein designated GAM RNA, and which when bound by GAM336716 RNA causes inhibition of translation of the GAM336716 target mRNA into a corresponding GAM336716 target protein.

The mechanism of the translational inhibition exerted by GAM336716 RNA, herein designated GAM RNA, on one or more GAM336716 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336716 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336716 RNA, herein designated GAM RNA, of GAM336716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336716 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336716 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336716 RNA correlate with, and may be deduced from, the identity of the GAM336716 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336717 7000 TCACTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAGGAGACG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGTTTGTGG Messenger 336717 (GAM336717) oligonucleotides modulates expression of respective target

TGAGCCGAGA genes whose function and utility is known in the art.

TCACACCATT GCACTCCAGC CTGGGCAACA ACAGTGA GAM336717 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336717 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336717 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336717 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336717 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336717 precursor RNA is designated SEQ ID:7000, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7000 is located from position 40002867 to position 40002943 relative to chromosome 4 on the `+` strand.

GAM336717 precursor RNA folds onto itself, forming GAM336717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336717 precursor RNA, designated SEQ ID NO: 7000, and a schematic representation of a predicted secondary folding of GAM336717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336717 folded precursor RNA yielding a GAM336717 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336717 RNA, hereby incorporated herein. Expression of GAM336717 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336717 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336717 target RNA, herein designated GAM TARGET RNA.

GAM336717 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336717 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336717 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336717 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336717 RNA, herein designated GAM RNA, to target binding sites on GAM336717 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336717 target RNA into GAM336717 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336717 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336717 target genes. The mRNA of each one of this plurality of GAM336717 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336717 RNA, herein designated GAM RNA, and which when bound by GAM336717 RNA causes inhibition of translation of the GAM336717 target mRNA into a corresponding GAM336717 target protein.

The mechanism of the translational inhibition exerted by GAM336717 RNA, herein designated GAM RNA, on one or more GAM336717 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336717 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336717 RNA, herein designated GAM RNA, of GAM336717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336717 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336717 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336717 RNA correlate with, and may be deduced from, the identity of the GAM336717 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGAGGAAGGG is described with additional reference to Figs. 9-15.

AGGAGCAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCAGCAGTT encoded by the human genome.

GAM336718 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336718 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336718 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336718 precursor RNA is designated SEQ ID:5753, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5753 is located from position 40074931 to position 40075020 relative to chromosome 22 on the `+` strand.

GAM336718 precursor RNA folds onto itself, forming GAM336718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336718 precursor RNA, designated SEQ ID NO: 5753, and a schematic representation of a predicted secondary folding of GAM336718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336718 folded precursor RNA yielding a GAM336718 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly

similar to the nucleotide sequence of GAM336718 RNA, hereby incorporated herein.

GAM336718 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336718 target RNA, herein designated GAM TARGET RNA.

GAM336718 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336718 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336718 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336718 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336718 RNA, herein designated GAM RNA, to target binding sites on GAM336718 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336718 target RNA into GAM336718 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336718 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336718 target genes. The mRNA of each one of this plurality of GAM336718 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336718 RNA, herein designated GAM RNA, and which when bound by GAM336718 RNA causes inhibition of translation of the GAM336718 target mRNA into a corresponding GAM336718 target protein.

The mechanism of the translational inhibition exerted by GAM336718 RNA, herein designated GAM RNA, on one or more GAM336718 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336718 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336718 RNA, herein designated GAM RNA, of GAM336718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336718 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336718 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336718 RNA correlate with, and may be deduced from, the identity of the GAM336718 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336719 6655 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCGGAGG Messenger 336719 (GAM336719) oligonucleotides modulates expression of respective target
TTGCGGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM336719 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336719 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGAAACTCC encoded by the human genome.

GAM336719 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336719 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336719 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336719 precursor RNA is designated SEQ ID:6655, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6655 is located from position 40082689 to position 40082777 relative to chromosome 22 on the `-` strand.

GAM336719 precursor RNA folds onto itself, forming GAM336719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336719 precursor RNA, designated SEQ ID NO: 6655, and a schematic representation of a predicted secondary folding of GAM336719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336719 folded precursor RNA yielding a GAM336719 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336719 RNA, hereby incorporated herein. Expression of GAM336719 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336719 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336719 target RNA, herein designated GAM TARGET RNA.

GAM336719 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336719 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336719 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336719 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336719 RNA, herein designated GAM RNA, to target binding sites on GAM336719 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336719 target RNA into GAM336719 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336719 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336719 target genes. The mRNA of each one of this plurality of GAM336719 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336719 RNA, herein designated GAM RNA, and which when bound by GAM336719 RNA causes inhibition of translation of the GAM336719 target mRNA into a corresponding GAM336719 target protein.

The mechanism of the translational inhibition exerted by GAM336719 RNA, herein designated GAM RNA, on one or more GAM336719 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336719 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336719 RNA, herein designated GAM RNA, of GAM336719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336719 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336719 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336719 RNA correlate with, and may be deduced from, the identity of the GAM336719 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336720 5800 AGTATCACTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAACCAGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCAGAGGCT Messenger 336720 (GAM336720) oligonucleotides modulates expression of respective target

GCATGCAGTG genes whose function and utility is known in the art.

AGCCAAGATT GAM336720 is a novel bioinformatically detectable regulatory, non protein

GCACCACTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336720 was detected

ACTCTAACCT is described with additional reference to Figs. 9-15.

GGGCAACAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATGATACT encoded by the human genome.

GAM336720 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336720 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336720 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336720 precursor RNA is designated SEQ ID:5800, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5800 is located from position 40086888 to position 40086975 relative to chromosome 17 on the `+` strand.

GAM336720 precursor RNA folds onto itself, forming GAM336720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336720 precursor RNA, designated SEQ ID NO: 5800, and a schematic representation of a predicted secondary folding of GAM336720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336720 folded precursor RNA yielding a GAM336720 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336720 RNA, hereby incorporated herein.

GAM336720 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336720 target RNA, herein designated GAM TARGET RNA.

GAM336720 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336720 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336720 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336720 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336720 RNA, herein designated GAM RNA, to target binding sites on GAM336720 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336720 target RNA into GAM336720 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336720 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336720 target genes. The mRNA of each one of this plurality of GAM336720 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336720 RNA, herein designated GAM RNA, and which when bound by GAM336720 RNA causes inhibition of translation of the GAM336720 target mRNA into a corresponding GAM336720 target protein.

The mechanism of the translational inhibition exerted by GAM336720 RNA, herein designated GAM RNA, on one or more GAM336720 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336720 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336720 RNA, herein designated GAM RNA, of GAM336720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336720 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336720 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336720 RNA correlate with, and may be deduced from, the identity of the GAM336720 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336722 5862 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336722 (GAM336722) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336722 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336722 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336722 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336722 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336722 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336722 precursor RNA is designated SEQ

ID:5862, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5862 is located from position 40227896 to position 40227977 relative to chromosome 8 on the `+` strand.

GAM336722 precursor RNA folds onto itself, forming GAM336722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336722 precursor RNA, designated SEQ ID NO: 5862, and a schematic representation of a predicted secondary folding of GAM336722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336722 folded precursor RNA yielding a GAM336722 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336722 RNA, hereby incorporated herein.

GAM336722 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336722 target RNA, herein designated GAM TARGET RNA.

GAM336722 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336722 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336722 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336722 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336722 RNA, herein designated GAM RNA, to target binding sites on GAM336722 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336722 target RNA into GAM336722 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336722 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336722 target genes. The mRNA of each one of this plurality of GAM336722 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336722 RNA, herein designated GAM RNA, and which when bound by GAM336722 RNA causes inhibition of translation of the GAM336722 target mRNA into a corresponding GAM336722 target protein.

The mechanism of the translational inhibition exerted by GAM336722 RNA, herein designated GAM RNA, on one or more GAM336722 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336722 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336722 RNA, herein designated GAM RNA, of GAM336722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336722 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336722 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336722 RNA correlate with, and may be deduced from, the identity of the GAM336722 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336723 6319 GAGAATCACT Fig. 8 further provides a conceptual description of another novel bioinformatically

TGAACCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGCAGAGGT Messenger 336723 (GAM336723) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

TGAGATTATG GAM336723 is a novel bioinformatically detectable regulatory, non protein

CCATTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336723 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

TGACAGAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAACTC encoded by the human genome.

GAM336723 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336723 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336723 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336723 precursor RNA is designated SEQ ID:6319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6319 is located from position 40285217 to position 40285302 relative to chromosome 19 on the `+` strand.

GAM336723 precursor RNA folds onto itself, forming GAM336723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336723 precursor RNA, designated SEQ ID NO: 6319, and a schematic representation of a predicted secondary folding of GAM336723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336723 folded precursor RNA yielding a GAM336723 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336723 RNA, hereby incorporated herein.

GAM336723 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336723 target RNA, herein designated GAM TARGET RNA.

GAM336723 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336723 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336723 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336723 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336723 RNA, herein designated GAM RNA, to target binding sites on GAM336723 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336723 target RNA into GAM336723 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336723 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336723 target genes. The mRNA of each one of this plurality of GAM336723 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336723 RNA, herein designated GAM RNA, and which when bound by GAM336723 RNA causes inhibition of translation of the GAM336723 target mRNA into a corresponding GAM336723 target protein.

The mechanism of the translational inhibition exerted by GAM336723 RNA, herein designated GAM RNA, on one or more GAM336723 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336723 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336723 RNA, herein designated GAM RNA, of GAM336723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336723 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336723 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336723 RNA correlate with, and may be deduced from, the identity of the GAM336723 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336727 6918 GTGGTCATAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTCCTTTCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGCTCTAATA Messenger 336727 (GAM336727) oligonucleotides modulates expression of respective target

ACCTGAGCTT genes whose function and utility is known in the art.

CTGTTATGAA GAM336727 is a novel bioinformatically detectable regulatory, non protein
GCTGGGACCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336727 was detected
TTAGAGCCTC is described with additional reference to Figs. 9-15.

AGGATGATCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTGTTTGTT encoded by the human genome.

TGTGAAGC GAM336727 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336727 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336727 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336727 precursor RNA is designated SEQ ID:6918, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6918 is located from position 40420544 to position 40420641 relative to chromosome 22 on the `+` strand.

GAM336727 precursor RNA folds onto itself, forming GAM336727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336727 precursor RNA, designated SEQ ID NO: 6918, and a schematic representation of a predicted secondary folding of GAM336727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336727 folded precursor RNA yielding a GAM336727 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336727 RNA, hereby incorporated herein.

GAM336727 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336727 target RNA, herein designated GAM TARGET RNA.

GAM336727 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336727 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336727 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336727 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336727 RNA, herein designated GAM RNA, to target binding sites on GAM336727 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336727 target RNA into GAM336727 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336727 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336727 target genes. The mRNA of each one of this plurality of GAM336727 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336727 RNA, herein designated GAM RNA, and which when bound by GAM336727 RNA causes inhibition of translation of the GAM336727 target mRNA into a corresponding GAM336727 target protein.

The mechanism of the translational inhibition exerted by GAM336727 RNA, herein designated GAM RNA, on one or more GAM336727 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336727 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336727 RNA, herein designated GAM RNA, of GAM336727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336727 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336727 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336727 RNA correlate with, and may be deduced from, the identity of the GAM336727 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTCAGCTCAC GAM336728 is a novel bioinformatically detectable regulatory, non protein
TGCAACCTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336728 was detected
ACCTCCTGGG is described with additional reference to Figs. 9-15.

TTCAAGCAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTCGTGCCT encoded by the human genome.

CAGCCTCCCA GAM336728 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AGTAGCTTGG GAM336728 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
ATT GAM336728 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336728 precursor RNA is designated SEQ ID:5808, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5808 is located from position 40578117 to position 40578229 relative to chromosome 19 on the `+` strand.

GAM336728 precursor RNA folds onto itself, forming GAM336728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336728 precursor RNA, designated SEQ ID NO: 5808, and a schematic representation of a predicted secondary folding of GAM336728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336728 folded precursor RNA yielding a GAM336728 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336728 RNA, hereby incorporated herein.

GAM336728 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336728 target RNA, herein designated GAM TARGET RNA.

GAM336728 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336728 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336728 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336728 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336728 RNA, herein designated GAM RNA, to target binding sites on GAM336728 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336728 target RNA into GAM336728 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336728 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336728 target genes. The mRNA of each one of this plurality of GAM336728 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336728 RNA, herein designated GAM RNA, and which when bound by GAM336728 RNA causes inhibition of translation of the GAM336728 target mRNA into a corresponding GAM336728 target protein.

The mechanism of the translational inhibition exerted by GAM336728 RNA, herein designated GAM RNA, on one or more GAM336728 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336728 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336728 RNA, herein designated GAM RNA, of GAM336728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336728 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336728 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336728 RNA correlate with, and may be deduced from, the identity of the GAM336728 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336729 (GAM336729) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336729 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336729 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336729 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336729 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336729 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336729 precursor RNA is designated SEQ ID:6705, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6705 is located from position 40608767 to position 40608864 relative to chromosome 15 on the `+` strand.

GAM336729 precursor RNA folds onto itself, forming GAM336729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336729 precursor RNA, designated SEQ ID NO: 6705, and a schematic representation of a predicted secondary folding of GAM336729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336729 folded precursor RNA yielding a GAM336729 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336729 RNA, hereby incorporated herein.

GAM336729 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336729 target RNA, herein designated GAM TARGET RNA.

GAM336729 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336729 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336729 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336729 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336729 RNA, herein designated GAM RNA, to target binding sites on GAM336729 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336729 target RNA into GAM336729 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336729 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336729 target genes. The mRNA of each one of this plurality of GAM336729 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336729 RNA, herein designated GAM RNA, and which when bound by GAM336729 RNA causes inhibition of translation of the GAM336729 target mRNA into a corresponding GAM336729 target protein.

The mechanism of the translational inhibition exerted by GAM336729 RNA, herein designated GAM RNA, on one or more GAM336729 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336729 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336729 RNA, herein designated GAM RNA, of

GAM336729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336729 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336729 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336729 RNA correlate with, and may be deduced from, the identity of the GAM336729 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336730 6472 GATCCCAAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTCATCTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTCTATGTCC Messenger 336730 (GAM336730) oligonucleotides modulates expression of respective target

TTGCTATGTA genes whose function and utility is known in the art.

TGTACAAAAA GAM336730 is a novel bioinformatically detectable regulatory, non protein

TGAGAAATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336730 was detected

AAATTGTGTT is described with additional reference to Figs. 9-15.

TAAAAACCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATCTCATTAC encoded by the human genome.

ATACTTTCTC GAM336730 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAACCACTCT GAM336730 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

TTGAGTGTCA GAM336730 precursor RNA does not encode a protein. A nucleotide sequence identical or

TTTTTGGGTC highly similar to the nucleotide sequence of GAM336730 precursor RNA is designated SEQ

ID:6472, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6472 is located from position 40623807 to position 40623936 relative to chromosome 11 on the `-` strand.

GAM336730 precursor RNA folds onto itself, forming GAM336730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336730 precursor RNA, designated SEQ ID NO: 6472, and a schematic representation of a predicted secondary folding of GAM336730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336730 folded precursor RNA yielding a GAM336730 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336730 RNA, hereby incorporated herein.

GAM336730 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336730 target RNA, herein designated GAM TARGET RNA.

GAM336730 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336730 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336730 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336730 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336730 RNA, herein designated GAM RNA, to target binding sites on GAM336730 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336730 target RNA into GAM336730 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336730 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336730 target genes. The mRNA of each one of this plurality of GAM336730 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336730 RNA, herein designated GAM RNA, and which when bound by GAM336730 RNA causes inhibition of translation of the GAM336730 target mRNA into a corresponding GAM336730 target protein.

The mechanism of the translational inhibition exerted by GAM336730 RNA, herein designated GAM RNA, on one or more GAM336730 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336730 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336730 RNA, herein designated GAM RNA, of GAM336730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336730 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336730 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336730 RNA correlate with, and may be deduced from, the identity of the GAM336730 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336731 7333 TTGGGCCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGCTTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAAGCCTTC Messenger 336731 (GAM336731) oligonucleotides modulates expression of respective target

TCTGTGTACT genes whose function and utility is known in the art.

CTGGAGATAG GAM336731 is a novel bioinformatically detectable regulatory, non protein

ATGGAGAAGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336731 was detected

GTTTTCAGAT is described with additional reference to Figs. 9-15.

TCCTGGGAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AG encoded by the human genome.

GAM336731 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336731 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336731 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336731 precursor RNA is designated SEQ ID:7333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7333 is located from position 40762540 to position 40762621 relative to chromosome 17 on the `-` strand.

GAM336731 precursor RNA folds onto itself, forming GAM336731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336731 precursor RNA, designated SEQ ID NO: 7333, and a schematic representation of a predicted secondary folding of GAM336731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336731 folded precursor RNA yielding a GAM336731 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336731 RNA, hereby incorporated herein.

GAM336731 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336731 target RNA, herein designated GAM TARGET RNA.

GAM336731 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336731 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336731 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336731 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336731 RNA, herein designated GAM RNA, to target binding sites on GAM336731 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336731 target RNA into GAM336731 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336731 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336731 target genes. The mRNA of each one of this

plurality of GAM336731 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336731 RNA, herein designated GAM RNA, and which when bound by GAM336731 RNA causes inhibition of translation of the GAM336731 target mRNA into a corresponding GAM336731 target protein.

The mechanism of the translational inhibition exerted by GAM336731 RNA, herein designated GAM RNA, on one or more GAM336731 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336731 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336731 RNA, herein designated GAM RNA, of GAM336731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336731 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336731 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336731 RNA correlate with, and may be deduced from, the identity of the GAM336731 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336732 7235 TGGGCCCAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGCTTTGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AAAGCCTTCT Messenger 336732 (GAM336732) oligonucleotides modulates expression of respective target

CTGTGTACTC genes whose function and utility is known in the art.

TGGAGATAGA GAM336732 is a novel bioinformatically detectable regulatory, non protein

TGGAGAAGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336732 was detected

TTTTCAGATT is described with additional reference to Figs. 9-15.

CCTGGGAACA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336732 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336732 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336732 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336732 precursor RNA is designated SEQ ID:7235, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7235 is located from position 40762541 to position 40762620 relative to chromosome 17 on the `-` strand.

GAM336732 precursor RNA folds onto itself, forming GAM336732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336732 precursor RNA, designated SEQ ID NO: 7235, and a schematic representation of a predicted secondary folding of GAM336732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336732 folded precursor RNA yielding a GAM336732 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336732 RNA, hereby incorporated herein.

GAM336732 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336732 target RNA, herein designated GAM TARGET RNA.

GAM336732 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336732 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336732 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336732 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336732 RNA, herein designated GAM RNA, to target binding sites on GAM336732 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336732 target RNA into GAM336732 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336732 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336732 target genes. The mRNA of each one of this plurality of GAM336732 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336732 RNA, herein designated GAM RNA, and which when bound by GAM336732 RNA causes inhibition of translation of the GAM336732 target mRNA into a corresponding GAM336732 target protein.

The mechanism of the translational inhibition exerted by GAM336732 RNA, herein designated GAM RNA, on one or more GAM336732 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336732 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336732 RNA, herein designated GAM RNA, of GAM336732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336732 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336732 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336732 RNA correlate with, and may be deduced from, the identity of the GAM336732 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336734 6487 GCAGAGGCAG Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGGGACTCT detected oligonucleotides of the present invention, referred to here as Genomic Address
GTGCCCATTG Messenger 336734 (GAM336734) oligonucleotides modulates expression of respective target
AAGAACTTGG genes whose function and utility is known in the art.

GAGTGTATTC GAM336734 is a novel bioinformatically detectable regulatory, non protein
TGGGAACAGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336734 was detected
CACCCATCTT is described with additional reference to Figs. 9-15.

CTCTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336734 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336734 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336734 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336734 precursor RNA is designated SEQ ID:6487, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6487 is located from position 40925498 to position 40925573 relative to chromosome 8 on the `-` strand.

GAM336734 precursor RNA folds onto itself, forming GAM336734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336734 precursor RNA, designated SEQ ID NO: 6487, and a schematic representation of a predicted secondary folding of GAM336734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336734 folded precursor RNA yielding a GAM336734 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336734 RNA, hereby incorporated herein.

GAM336734 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336734 target RNA, herein designated GAM TARGET RNA.

GAM336734 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336734 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336734 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336734 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336734 RNA, herein designated GAM RNA, to target binding sites on GAM336734 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336734 target RNA into GAM336734 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336734 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336734 target genes. The mRNA of each one of this plurality of GAM336734 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336734 RNA, herein designated GAM RNA, and which when bound by GAM336734 RNA causes inhibition of translation of the GAM336734 target mRNA into a corresponding GAM336734 target protein.

The mechanism of the translational inhibition exerted by GAM336734 RNA, herein designated GAM RNA, on one or more GAM336734 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336734 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336734 RNA, herein designated GAM RNA, of GAM336734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336734 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336734 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336734 RNA correlate with, and may be deduced from, the identity of the GAM336734 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336736 5863 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336736 (GAM336736) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336736 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336736 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336736 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336736 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336736 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336736 precursor RNA is designated SEQ ID:5863, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5863 is located from position 41122390 to position 41122471 relative to chromosome 4 on the `+` strand.

GAM336736 precursor RNA folds onto itself, forming GAM336736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336736 precursor RNA, designated SEQ ID NO: 5863, and a schematic representation of a predicted secondary folding of GAM336736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336736 folded precursor RNA yielding a GAM336736 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336736 RNA, hereby incorporated herein.

GAM336736 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336736 target RNA, herein designated GAM TARGET RNA.

GAM336736 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336736 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336736 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336736 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336736 RNA, herein designated GAM RNA, to target binding sites on GAM336736 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336736 target RNA into GAM336736 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336736 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336736 target genes. The mRNA of each one of this plurality of GAM336736 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336736 RNA, herein designated GAM RNA, and which when bound by GAM336736 RNA causes inhibition of translation of the GAM336736 target mRNA into a corresponding GAM336736 target protein.

The mechanism of the translational inhibition exerted by GAM336736 RNA, herein designated GAM RNA, on one or more GAM336736 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336736 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336736 RNA, herein designated GAM RNA, of GAM336736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336736 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336736 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336736 RNA correlate with, and may be deduced from, the identity of the GAM336736 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336738 7131 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AACCCGGGAG Messenger 336738 (GAM336738) oligonucleotides modulates expression of respective target
GCAGAGGTTG genes whose function and utility is known in the art.

CAGTGAGCCA GAM336738 is a novel bioinformatically detectable regulatory, non protein
AGATCGCACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336738 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGGGCGA encoded by the human genome.

GACTCTGTCT GAM336738 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM336738 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336738 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336738 precursor RNA is designated SEQ ID:7131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7131 is located from position 41382416 to position 41382517 relative to chromosome 17 on the `+` strand.

GAM336738 precursor RNA folds onto itself, forming GAM336738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336738 precursor RNA, designated SEQ ID NO: 7131, and a schematic representation of a predicted secondary folding of GAM336738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336738 folded precursor RNA yielding a GAM336738 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336738 RNA, hereby incorporated herein. Expression of GAM336738 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336738 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336738 target RNA, herein designated GAM TARGET RNA.

GAM336738 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336738 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336738 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336738 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336738 RNA, herein designated GAM RNA, to target binding sites on GAM336738 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336738 target RNA into GAM336738 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336738 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336738 target genes. The mRNA of each one of this plurality of GAM336738 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336738 RNA, herein designated GAM RNA, and which when bound by GAM336738 RNA causes inhibition of translation of the GAM336738 target mRNA into a corresponding GAM336738 target protein.

The mechanism of the translational inhibition exerted by GAM336738 RNA, herein designated GAM RNA, on one or more GAM336738 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336738 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336738 RNA, herein designated GAM RNA, of GAM336738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336738 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336738 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336738 RNA correlate with, and may be deduced from, the identity of the GAM336738 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336739 6225 CTGGAGGCTC Fig. 8 further provides a conceptual description of another novel bioinformatically
AGGAGTCTTT detected oligonucleotides of the present invention, referred to here as Genomic Address
TATCTGCAAT Messenger 336739 (GAM336739) oligonucleotides modulates expression of respective target
AGGACAATGA genes whose function and utility is known in the art.

TTCTCCTAGC GAM336739 is a novel bioinformatically detectable regulatory, non protein
AGATCTGTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336739 was detected
CTCCTATGCT is described with additional reference to Figs. 9-15.

CAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336739 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336739 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336739 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336739 precursor RNA is designated SEQ ID:6225, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6225 is located from position 41425604 to position 41425676 relative to chromosome 20 on the `+` strand.

GAM336739 precursor RNA folds onto itself, forming GAM336739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336739 precursor RNA, designated SEQ ID NO: 6225, and a schematic representation of a predicted secondary folding of GAM336739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336739 folded precursor RNA yielding a GAM336739 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336739 RNA, hereby incorporated herein.

GAM336739 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336739 target RNA, herein designated GAM TARGET RNA.

GAM336739 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336739 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336739 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336739 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336739 RNA, herein designated GAM RNA, to target binding sites on GAM336739 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336739 target RNA into GAM336739 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336739 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336739 target genes. The mRNA of each one of this plurality of GAM336739 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336739 RNA, herein designated GAM RNA, and which when bound by GAM336739 RNA causes inhibition of translation of the GAM336739 target mRNA into a corresponding GAM336739 target protein.

The mechanism of the translational inhibition exerted by GAM336739 RNA, herein designated GAM RNA, on one or more GAM336739 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336739 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336739 RNA, herein designated GAM RNA, of GAM336739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336739 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336739 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336739 RNA correlate with, and may be deduced from, the identity of the GAM336739 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ATTTTGGGGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336740 was detected

CAGCTAGGAC is described with additional reference to Figs. 9-15.

CCATGCAGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336740 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336740 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336740 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336740 precursor RNA is designated SEQ ID:5959, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5959 is located from position 41446302 to position 41446381 relative to chromosome 17 on the `-` strand.

GAM336740 precursor RNA folds onto itself, forming GAM336740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336740 precursor RNA, designated SEQ ID NO: 5959, and a schematic representation of a predicted secondary folding of GAM336740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336740 folded precursor RNA yielding a GAM336740 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336740 RNA, hereby incorporated herein.

GAM336740 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336740 target RNA, herein designated GAM TARGET RNA.

GAM336740 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336740 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336740 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336740 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336740 RNA, herein designated GAM RNA, to target binding sites on GAM336740 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336740 target RNA into GAM336740 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336740 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336740 target genes. The mRNA of each one of this plurality of GAM336740 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336740 RNA, herein designated GAM RNA, and which when bound by GAM336740 RNA causes inhibition of translation of the GAM336740 target mRNA into a corresponding GAM336740 target protein.

The mechanism of the translational inhibition exerted by GAM336740 RNA, herein designated GAM RNA, on one or more GAM336740 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336740 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336740 RNA, herein designated GAM RNA, of GAM336740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336740 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336740 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336740 RNA correlate with, and may be deduced from, the identity of the GAM336740 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336743 6138 CGCACATCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TCAGAGACTT Messenger 336743 (GAM336743) oligonucleotides modulates expression of respective target
CATTTTGTTG genes whose function and utility is known in the art.

ATAAACCCTA GAM336743 is a novel bioinformatically detectable regulatory, non protein
TGAATGTAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336743 was detected
GAATGTGGGA is described with additional reference to Figs. 9-15.

AGGCGTTCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGTGCG encoded by the human genome.

GAM336743 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336743 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336743 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336743 precursor RNA is designated SEQ ID:6138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6138 is located from position 41560746 to position 41560831 relative to chromosome 19 on the `-` strand.

GAM336743 precursor RNA folds onto itself, forming GAM336743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336743 precursor RNA, designated SEQ ID NO: 6138, and a schematic representation of a predicted secondary folding of GAM336743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336743 folded precursor RNA yielding a GAM336743 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336743 RNA, hereby incorporated herein.

GAM336743 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336743 target RNA, herein designated GAM TARGET RNA.

GAM336743 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336743 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336743 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336743 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336743 RNA, herein designated GAM RNA, to target binding sites on GAM336743 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336743 target RNA into GAM336743 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336743 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336743 target genes. The mRNA of each one of this

plurality of GAM336743 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336743 RNA, herein designated GAM RNA, and which when bound by GAM336743 RNA causes inhibition of translation of the GAM336743 target mRNA into a corresponding GAM336743 target protein.

The mechanism of the translational inhibition exerted by GAM336743 RNA, herein designated GAM RNA, on one or more GAM336743 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336743 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336743 RNA, herein designated GAM RNA, of GAM336743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336743 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336743 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336743 RNA correlate with, and may be deduced from, the identity of the GAM336743 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336744 6958 TAAGGAATGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAAAAACCT detected oligonucleotides of the present invention, referred to here as Genomic Address

TTATTTGTGG Messenger 336744 (GAM336744) oligonucleotides modulates expression of respective target

CTCAGACCTT genes whose function and utility is known in the art.

ACTCGACATC GAM336744 is a novel bioinformatically detectable regulatory, non protein

ACAGAATTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336744 was detected

CACTGGTGAG is described with additional reference to Figs. 9-15.

AAACCCTATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AATGTAAGGA encoded by the human genome.

ATGTGGGAAA GAM336744 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GCCTTTAGTA GAM336744 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GTGGTTCAAA GAM336744 precursor RNA does not encode a protein. A nucleotide sequence identical or

CTTCACTCGA highly similar to the nucleotide sequence of GAM336744 precursor RNA is designated SEQ

ID:6958, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6958 is located from position 41616369 to position 41616498 relative to chromosome 19 on the `-` strand.

GAM336744 precursor RNA folds onto itself, forming GAM336744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336744 precursor RNA, designated SEQ ID NO: 6958, and a schematic representation of a predicted secondary folding of GAM336744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336744 folded precursor RNA yielding a GAM336744 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336744 RNA, hereby incorporated herein.

GAM336744 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336744 target RNA, herein designated GAM TARGET RNA.

GAM336744 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336744 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336744 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336744 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336744 RNA, herein designated GAM RNA, to target binding sites on GAM336744 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336744 target RNA into GAM336744 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336744 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336744 target genes. The mRNA of each one of this plurality of GAM336744 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336744 RNA, herein designated GAM RNA, and which when bound by GAM336744 RNA causes inhibition of translation of the GAM336744 target mRNA into a corresponding GAM336744 target protein.

The mechanism of the translational inhibition exerted by GAM336744 RNA, herein designated GAM RNA, on one or more GAM336744 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336744 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336744 RNA, herein designated GAM RNA, of GAM336744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336744 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336744 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336744 RNA correlate with, and may be deduced from, the identity of the GAM336744 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336745 5756 AGGAATGTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAAACCTTT detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTTGTGGCT Messenger 336745 (GAM336745) oligonucleotides modulates expression of respective target

CAGACCTTAC genes whose function and utility is known in the art.

TCGACATCAC GAM336745 is a novel bioinformatically detectable regulatory, non protein

AGAATTCACA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336745 was detected

CTGGTGAGAA is described with additional reference to Figs. 9-15.

ACCCTATGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGTAAGGAAT encoded by the human genome.

GTGGGAAAGC GAM336745 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTTTAGTAGT GAM336745 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GGTTCAAACT GAM336745 precursor RNA does not encode a protein. A nucleotide sequence identical or

TCACT highly similar to the nucleotide sequence of GAM336745 precursor RNA is designated SEQ ID:5756, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5756 is located from position 41616372 to position 41616496 relative to chromosome 19 on the `-` strand.

GAM336745 precursor RNA folds onto itself, forming GAM336745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336745 precursor RNA, designated SEQ ID NO: 5756, and a schematic representation of a predicted secondary folding of GAM336745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336745 folded precursor RNA yielding a GAM336745 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336745 RNA, hereby incorporated herein.

GAM336745 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336745 target RNA, herein designated GAM TARGET RNA.

GAM336745 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336745 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336745 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336745 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336745 RNA, herein designated GAM RNA, to target binding sites on GAM336745 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336745 target RNA into GAM336745 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336745 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336745 target genes. The mRNA of each one of this plurality of GAM336745 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336745 RNA, herein designated GAM RNA, and which when bound by GAM336745 RNA causes inhibition of translation of the GAM336745 target mRNA into a corresponding GAM336745 target protein.

The mechanism of the translational inhibition exerted by GAM336745 RNA, herein designated GAM RNA, on one or more GAM336745 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336745 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336745 RNA, herein designated GAM RNA, of GAM336745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336745 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336745 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336745 RNA correlate with, and may be deduced from, the identity of the GAM336745 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGGTGGAGGC Messenger 336746 (GAM336746) oligonucleotides modulates expression of respective target
TGCAGTAAGC genes whose function and utility is known in the art.

CGAGATTGTG GAM336746 is a novel bioinformatically detectable regulatory, non protein
CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336746 was detected
CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAAACTATCT encoded by the human genome.

C GAM336746 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336746 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336746 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336746 precursor RNA is designated SEQ ID:6324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6324 is located from position 41616885 to position 41616975 relative to chromosome 8 on the `+` strand.

GAM336746 precursor RNA folds onto itself, forming GAM336746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336746 precursor RNA, designated SEQ ID NO: 6324, and a schematic representation of a predicted secondary folding of GAM336746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336746 folded precursor RNA yielding a GAM336746 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336746 RNA, hereby incorporated herein. Expression of GAM336746 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336746 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336746 target RNA, herein designated GAM TARGET RNA.

GAM336746 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336746 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336746 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336746 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336746 RNA, herein designated GAM RNA, to target binding sites on GAM336746 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336746 target RNA into GAM336746 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336746 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336746 target genes. The mRNA of each one of this plurality of GAM336746 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336746 RNA, herein designated GAM RNA, and which when bound by GAM336746 RNA causes inhibition of translation of the GAM336746 target mRNA into a corresponding GAM336746 target protein.

The mechanism of the translational inhibition exerted by GAM336746 RNA, herein designated GAM RNA, on one or more GAM336746 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336746 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336746 RNA, herein designated GAM RNA, of GAM336746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336746 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336746 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336746 RNA correlate with, and may be deduced from, the identity of the GAM336746 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGCTGCAGTA Messenger 336747 (GAM336747) oligonucleotides modulates expression of respective target
AGCCGAGATT genes whose function and utility is known in the art.

GTGCCACTGC GAM336747 is a novel bioinformatically detectable regulatory, non protein
ACTCCAGCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336747 was detected
GGGCAACAAG is described with additional reference to Figs. 9-15.

AGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336747 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336747 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336747 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336747 precursor RNA is designated SEQ ID:6561, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6561 is located from position 41616892 to position 41616964 relative to chromosome 8 on the `+` strand.

GAM336747 precursor RNA folds onto itself, forming GAM336747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336747 precursor RNA, designated SEQ ID NO: 6561, and a schematic representation of a predicted secondary folding of GAM336747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336747 folded precursor RNA yielding a GAM336747 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336747 RNA, hereby incorporated herein. Expression of GAM336747 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336747 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336747 target RNA, herein designated GAM TARGET RNA.

GAM336747 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336747 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336747 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336747 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336747 RNA, herein designated GAM RNA, to target binding sites on GAM336747 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336747 target RNA into GAM336747 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336747 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336747 target genes. The mRNA of each one of this plurality of GAM336747 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336747 RNA, herein designated GAM RNA, and which when bound by GAM336747 RNA causes inhibition of translation of the GAM336747 target mRNA into a corresponding GAM336747 target protein.

The mechanism of the translational inhibition exerted by GAM336747 RNA, herein designated GAM RNA, on one or more GAM336747 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336747 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336747 RNA, herein designated GAM RNA, of GAM336747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336747 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336747 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336747 RNA correlate with, and may be deduced from, the identity of the GAM336747 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336749 6865 GTAGTCCACC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCATAAAATC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGAAAGTATT Messenger 336749 (GAM336749) oligonucleotides modulates expression of respective target
ACTGGTCTCC genes whose function and utility is known in the art.

CACTTTTAGG GAM336749 is a novel bioinformatically detectable regulatory, non protein
CTATTAACGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336749 was detected
TTGTAGTGAG is described with additional reference to Figs. 9-15.

AGTTTGTAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTTCTTGTCG encoded by the human genome.

TGGTTGCCAG GAM336749 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GGGCTGGGGG GAM336749 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
C GAM336749 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336749 precursor RNA is designated SEQ ID:6865, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6865 is located from position 41749003 to position 41749113 relative to chromosome 19 on the `+` strand.

GAM336749 precursor RNA folds onto itself, forming GAM336749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336749 precursor RNA, designated SEQ ID NO: 6865, and a schematic representation of a predicted secondary folding of GAM336749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336749 folded precursor RNA yielding a GAM336749 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336749 RNA, hereby incorporated herein.

GAM336749 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336749 target RNA, herein designated GAM TARGET RNA.

GAM336749 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336749 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336749 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336749 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336749 RNA, herein designated GAM RNA, to target binding sites on GAM336749 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336749 target RNA into GAM336749 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336749 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336749 target genes. The mRNA of each one of this plurality of GAM336749 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336749 RNA, herein designated GAM RNA, and which when bound by GAM336749 RNA causes inhibition of translation of the GAM336749 target mRNA into a corresponding GAM336749 target protein.

The mechanism of the translational inhibition exerted by GAM336749 RNA, herein

designated GAM RNA, on one or more GAM336749 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336749 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336749 RNA, herein designated GAM RNA, of GAM336749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336749 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336749 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336749 RNA correlate with, and may be deduced from, the identity of the GAM336749 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336750 7157 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATGGCGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 336750 (GAM336750) oligonucleotides modulates expression of respective target

GCGGAGCTTG genes whose function and utility is known in the art.

CAGTGAGCCG GAM336750 is a novel bioinformatically detectable regulatory, non protein

AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336750 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGTGAG encoded by the human genome.

ACTCCGTCTC GAM336750 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336750 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336750 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336750 precursor RNA is designated SEQ ID:7157, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:7157 is located from position 41757315 to position 41757415 relative to chromosome 6 on the `-` strand.

GAM336750 precursor RNA folds onto itself, forming GAM336750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336750 precursor RNA, designated SEQ ID NO: 7157, and a schematic representation of a predicted secondary folding of GAM336750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336750 folded precursor RNA yielding a GAM336750 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336750 RNA, hereby incorporated herein. Expression of GAM336750 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336750 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336750 target RNA, herein designated GAM TARGET RNA.

GAM336750 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336750 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336750 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336750 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336750 RNA, herein designated GAM RNA, to target binding sites on GAM336750 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336750 target RNA into GAM336750 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336750 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336750 target genes. The mRNA of each one of this plurality of GAM336750 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336750 RNA, herein designated GAM RNA, and which when bound by GAM336750 RNA causes inhibition of translation of the GAM336750 target mRNA into a corresponding GAM336750 target protein.

The mechanism of the translational inhibition exerted by GAM336750 RNA, herein designated GAM RNA, on one or more GAM336750 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336750 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336750 RNA, herein designated GAM RNA, of GAM336750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336750 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336750 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336750 RNA correlate with, and may be deduced from, the identity of the GAM336750 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336751 5761 AGGATCACTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGCCTGGTA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTCGAGGCT Messenger 336751 (GAM336751) oligonucleotides modulates expression of respective target

GCAGTGAGCT genes whose function and utility is known in the art.

ATGATCGTGC GAM336751 is a novel bioinformatically detectable regulatory, non protein

CACTGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336751 was detected

CAACCAGGCT is described with additional reference to Figs. 9-15.

GACCGAGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACCCT encoded by the human genome.

GAM336751 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336751 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336751 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336751 precursor RNA is designated SEQ ID:5761, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5761 is located from position 41765141 to position 41765226 relative to chromosome 8 on the `+` strand.

GAM336751 precursor RNA folds onto itself, forming GAM336751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336751 precursor RNA, designated SEQ ID NO: 5761, and a schematic representation of a predicted secondary folding of GAM336751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336751 folded precursor RNA yielding a GAM336751 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336751 RNA, hereby incorporated herein.

GAM336751 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336751 target RNA, herein designated GAM TARGET RNA.

GAM336751 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336751 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336751 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336751 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336751 RNA, herein designated GAM RNA, to target binding sites on GAM336751 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336751 target RNA into GAM336751 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336751 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336751 target genes. The mRNA of each one of this plurality of GAM336751 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336751 RNA, herein designated GAM RNA, and which when bound by GAM336751 RNA causes inhibition of translation of the GAM336751 target mRNA into a corresponding GAM336751 target protein.

The mechanism of the translational inhibition exerted by GAM336751 RNA, herein designated GAM RNA, on one or more GAM336751 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336751 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336751 RNA, herein designated GAM RNA, of GAM336751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336751 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336751 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336751 RNA correlate with, and may be deduced from, the identity of the GAM336751 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336752 5970 ATGCCTAATT Fig. 8 further provides a conceptual description of another novel bioinformatically

TAGCACATAG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCCTGTCCC Messenger 336752 (GAM336752) oligonucleotides modulates expression of respective target

CAAAATCTAA genes whose function and utility is known in the art.

TAAACTCAGA GAM336752 is a novel bioinformatically detectable regulatory, non protein
AGTAATAAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336752 was detected
TTTCTGGGTT is described with additional reference to Figs. 9-15.

TTTGTGGGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCCCTCTGA encoded by the human genome.

GCTAGGGTAG GAM336752 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TTAAAAGTTG GAM336752 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CAT GAM336752 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336752 precursor RNA is designated SEQ ID:5970, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5970 is located from position 41880845 to position 41880957 relative to chromosome 7 on the `-` strand.

GAM336752 precursor RNA folds onto itself, forming GAM336752 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

GTGGAGGCTG genes whose function and utility is known in the art.

TGGTGAGCTG GAM336755 is a novel bioinformatically detectable regulatory, non protein
AGATTGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336755 was detected
ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCGA encoded by the human genome.

AACTCCATCT GAM336755 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM336755 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336755 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336755 precursor RNA is designated SEQ ID:7138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7138 is located from position 42527933 to position 42528034 relative to chromosome 17 on the `-` strand.

GAM336755 precursor RNA folds onto itself, forming GAM336755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336755 precursor RNA, designated SEQ ID NO: 7138, and a schematic representation of a predicted secondary folding of GAM336755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336755 folded precursor RNA yielding a GAM336755 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336755 RNA, hereby incorporated herein. Expression of GAM336755 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336755 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336755 target RNA, herein designated GAM TARGET RNA.

GAM336755 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336755 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336755 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336755 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336755 RNA, herein designated GAM RNA, to target binding sites on GAM336755 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336755 target RNA into GAM336755 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336755 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336755 target genes. The mRNA of each one of this plurality of GAM336755 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336755 RNA, herein designated GAM RNA, and which when bound by GAM336755 RNA causes inhibition of translation of the GAM336755 target mRNA into a corresponding GAM336755 target protein.

The mechanism of the translational inhibition exerted by GAM336755 RNA, herein designated GAM RNA, on one or more GAM336755 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336755 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336755 RNA, herein designated GAM RNA, of GAM336755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336755 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336755 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336755 RNA correlate with, and may be deduced from, the identity of the GAM336755 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336756 6632 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 336756 (GAM336756) oligonucleotides modulates expression of respective target
CTGTGGTGAG genes whose function and utility is known in the art.

CTGAGATTGC GAM336756 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336756 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGAAACTCC encoded by the human genome.

GAM336756 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336756 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336756 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336756 precursor RNA is designated SEQ ID:6632, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6632 is located from position 42527939 to position 42528027 relative to chromosome 17 on the `-` strand.

GAM336756 precursor RNA folds onto itself, forming GAM336756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336756 precursor RNA, designated SEQ ID NO: 6632, and a schematic representation of a predicted secondary folding of GAM336756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336756 folded precursor

RNA yielding a GAM336756 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336756 RNA, hereby incorporated herein. Expression of GAM336756 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336756 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336756 target RNA, herein designated GAM TARGET RNA.

GAM336756 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336756 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336756 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336756 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336756 RNA, herein designated GAM RNA, to target binding sites on GAM336756 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336756 target RNA into GAM336756 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336756 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336756 target genes. The mRNA of each one of this plurality of GAM336756 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336756 RNA, herein designated GAM RNA, and which when bound by GAM336756 RNA causes inhibition of translation of the GAM336756 target mRNA into a corresponding GAM336756 target protein.

The mechanism of the translational inhibition exerted by GAM336756 RNA, herein designated GAM RNA, on one or more GAM336756 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336756 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336756 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336756 RNA, herein designated GAM RNA, of GAM336756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336756 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336756 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336756 RNA correlate with, and may be deduced from, the identity of the GAM336756 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336757 6189 CTCTTTGAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TCTGTTGTTC detected oligonucleotides of the present invention, referred to here as Genomic Address
AGAAAAATTT Messenger 336757 (GAM336757) oligonucleotides modulates expression of respective target
CTTGGAAAAT genes whose function and utility is known in the art.

ATGATTGTTC GAM336757 is a novel bioinformatically detectable regulatory, non protein
ATGGACAACG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336757 was detected
GACCTCATCA is described with additional reference to Figs. 9-15.

CCCAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336757 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336757 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336757 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336757 precursor RNA is designated SEQ ID:6189, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6189 is located from position 42675594 to position 42675671 relative to chromosome 8 on the `+` strand.

GAM336757 precursor RNA folds onto itself, forming GAM336757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336757 precursor RNA, designated SEQ ID NO: 6189, and a schematic representation of a predicted secondary folding of GAM336757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336757 folded precursor RNA yielding a GAM336757 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336757 RNA, hereby incorporated herein.

GAM336757 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336757 target RNA, herein designated GAM TARGET RNA.

GAM336757 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336757 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336757 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336757 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336757 RNA, herein designated GAM RNA, to target binding sites on GAM336757 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336757 target RNA into GAM336757 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336757 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336757 target genes. The mRNA of each one of this plurality of GAM336757 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336757 RNA, herein designated GAM RNA, and which when bound by GAM336757 RNA causes inhibition of translation of the GAM336757 target mRNA into a corresponding GAM336757 target protein.

The mechanism of the translational inhibition exerted by GAM336757 RNA, herein

designated GAM RNA, on one or more GAM336757 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336757 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336757 RNA, herein designated GAM RNA, of GAM336757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336757 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336757 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336757 RNA correlate with, and may be deduced from, the identity of the GAM336757 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336760 7313 TTGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CCAAGAGGTG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTTGCAG Messenger 336760 (GAM336760) oligonucleotides modulates expression of respective target

TGAGCTGAGA genes whose function and utility is known in the art.

TTGCGCCACT GAM336760 is a novel bioinformatically detectable regulatory, non protein

GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336760 was detected

CTGGGCAACA is described with additional reference to Figs. 9-15.

AGAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336760 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336760 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336760 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336760 precursor RNA is designated SEQ ID:7313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7313 is located from position 42757406 to position 42757482

relative to chromosome 6 on the `-` strand.

GAM336760 precursor RNA folds onto itself, forming GAM336760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336760 precursor RNA, designated SEQ ID NO: 7313, and a schematic representation of a predicted secondary folding of GAM336760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336760 folded precursor RNA yielding a GAM336760 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336760 RNA, hereby incorporated herein. Expression of GAM336760 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336760 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336760 target RNA, herein designated GAM TARGET RNA.

GAM336760 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336760 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336760 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336760 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336760 RNA, herein designated GAM RNA, to target binding sites on GAM336760 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336760 target RNA into GAM336760 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336760 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336760 target genes. The mRNA of each one of this plurality of GAM336760 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336760 RNA, herein designated GAM RNA, and which when bound by GAM336760 RNA causes inhibition of translation of the GAM336760 target mRNA into a corresponding GAM336760 target protein.

The mechanism of the translational inhibition exerted by GAM336760 RNA, herein designated GAM RNA, on one or more GAM336760 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336760 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336760 RNA, herein designated GAM RNA, of GAM336760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336760 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336760 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336760 RNA correlate with, and may be deduced from, the identity of the GAM336760 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGCCGGACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336761 was detected
AGTTTTCTCT is described with additional reference to Figs. 9-15.

GAGTTTTTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

T encoded by the human genome.

GAM336761 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336761 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336761 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336761 precursor RNA is designated SEQ ID:5693, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5693 is located from position 42800191 to position 42800271 relative to chromosome 21 on the `+` strand.

GAM336761 precursor RNA folds onto itself, forming GAM336761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336761 precursor RNA, designated SEQ ID NO: 5693, and a schematic representation of a predicted secondary folding of GAM336761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336761 folded precursor RNA yielding a GAM336761 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336761 RNA, hereby incorporated herein.

GAM336761 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336761 target RNA, herein designated GAM TARGET RNA.

GAM336761 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336761 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336761 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336761 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336761 RNA, herein designated GAM RNA, to target binding sites on GAM336761 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336761 target RNA into GAM336761 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336761 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336761 target genes. The mRNA of each one of this plurality of GAM336761 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336761 RNA, herein designated GAM RNA, and which when bound by GAM336761 RNA causes inhibition of translation of the GAM336761 target mRNA into a corresponding GAM336761 target protein.

The mechanism of the translational inhibition exerted by GAM336761 RNA, herein designated GAM RNA, on one or more GAM336761 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336761 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336761 RNA, herein designated GAM RNA, of GAM336761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336761 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336761 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336761 RNA correlate with, and may be deduced from, the identity of the GAM336761 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336762 7282 TGTTGGCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GATTGTCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

ATCTCCTGAC Messenger 336762 (GAM336762) oligonucleotides modulates expression of respective target

CTTGTGATCG genes whose function and utility is known in the art.

GCCCACCTCG GAM336762 is a novel bioinformatically detectable regulatory, non protein
GCCTCCCAAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336762 was detected
GTACTGAGAT is described with additional reference to Figs. 9-15.

TACAGACGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGCCACCA encoded by the human genome.

GAM336762 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336762 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336762 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336762 precursor RNA is designated SEQ ID:7282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7282 is located from position 42860934 to position 42861021 relative to chromosome 19 on the `-` strand.

GAM336762 precursor RNA folds onto itself, forming GAM336762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336762 precursor RNA, designated SEQ ID NO: 7282, and a schematic representation of a predicted secondary folding of GAM336762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336762 folded precursor RNA yielding a GAM336762 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336762 RNA, hereby incorporated herein.

GAM336762 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336762 target RNA, herein designated GAM TARGET RNA.

GAM336762 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336762 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336762 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336762 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336762 RNA, herein designated GAM RNA, to target binding sites on GAM336762 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336762 target RNA into GAM336762 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336762 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336762 target genes. The mRNA of each one of this plurality of GAM336762 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336762 RNA, herein designated GAM RNA, and which when bound by GAM336762 RNA causes inhibition of translation of the GAM336762 target mRNA into a corresponding GAM336762 target protein.

The mechanism of the translational inhibition exerted by GAM336762 RNA, herein designated GAM RNA, on one or more GAM336762 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336762 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336762 RNA, herein designated GAM RNA, of GAM336762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336762 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336762 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336762 RNA correlate with, and may be deduced from, the identity of the GAM336762 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336763 6708 GGAGATGGTT Fig. 8 further provides a conceptual description of another novel bioinformatically
TCCAGTTCAC detected oligonucleotides of the present invention, referred to here as Genomic Address
CGTCAACCCA Messenger 336763 (GAM336763) oligonucleotides modulates expression of respective target
AAAGCTCTCT genes whose function and utility is known in the art.

TCAGGTCATG GAM336763 is a novel bioinformatically detectable regulatory, non protein
GCAAACAGAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336763 was detected
CAGGGCTGTG is described with additional reference to Figs. 9-15.

GGTGTGGCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCTTGGCAC encoded by the human genome.

TGACTCC GAM336763 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336763 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336763 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336763 precursor RNA is designated SEQ ID:6708, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6708 is located from position 42899850 to position 42899946 relative to chromosome 22 on the `-` strand.

GAM336763 precursor RNA folds onto itself, forming GAM336763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336763 precursor RNA, designated SEQ ID NO: 6708, and a schematic representation of a predicted secondary folding of GAM336763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336763 folded precursor RNA yielding a GAM336763 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336763 RNA, hereby incorporated herein. Expression of GAM336763 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336763 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336763 target RNA, herein designated GAM TARGET RNA.

GAM336763 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336763 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336763 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336763 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336763 RNA, herein designated GAM RNA, to target binding sites on GAM336763 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336763 target RNA into GAM336763 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336763 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336763 target genes. The mRNA of each one of this plurality of GAM336763 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336763 RNA, herein designated GAM RNA, and which when bound by GAM336763 RNA causes inhibition of translation of the GAM336763 target mRNA into a corresponding GAM336763 target protein.

The mechanism of the translational inhibition exerted by GAM336763 RNA, herein designated GAM RNA, on one or more GAM336763 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336763 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336763 RNA, herein designated GAM RNA, of GAM336763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336763 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336763 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336763 RNA correlate with, and may be deduced from, the identity of the GAM336763 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336764 6369 GAGGATGGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGCAGAAGT Messenger 336764 (GAM336764) oligonucleotides modulates expression of respective target
TGCAGTGAGC genes whose function and utility is known in the art.

TGAAATCATG GAM336764 is a novel bioinformatically detectable regulatory, non protein
CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336764 was detected
CCAGCCTGGG is described with additional reference to Figs. 9-15.

TGATAGAGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAACCTT encoded by the human genome.

GAM336764 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336764 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336764 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336764 precursor RNA is designated SEQ ID:6369, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6369 is located from position 42908008 to position 42908094 relative to chromosome 20 on the `+` strand.

GAM336764 precursor RNA folds onto itself, forming GAM336764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336764 precursor RNA, designated SEQ ID NO: 6369, and a schematic representation of a predicted secondary folding of GAM336764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336764 folded precursor RNA yielding a GAM336764 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336764 RNA, hereby incorporated herein.

GAM336764 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336764 target RNA, herein designated GAM TARGET RNA.

GAM336764 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336764 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336764 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336764 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336764 RNA, herein designated GAM RNA, to target binding sites on GAM336764 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336764 target RNA into GAM336764 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336764 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336764 target genes. The mRNA of each one of this plurality of GAM336764 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336764 RNA, herein designated GAM RNA, and which when bound by GAM336764 RNA causes inhibition of translation of the GAM336764 target mRNA into a corresponding GAM336764 target protein.

The mechanism of the translational inhibition exerted by GAM336764 RNA, herein designated GAM RNA, on one or more GAM336764 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336764 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336764 RNA, herein designated GAM RNA, of GAM336764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336764 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336764 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336764 RNA correlate with, and may be deduced from, the identity of the GAM336764 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336765 7261 TGGTTTGAGC CCAGGAGGCA GAAGTTGCAG TGAGCTGAAA TCATGCCACT GCACTCCAGC CTGGGTGATA GAGCCA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336765 (GAM336765) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336765 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336765 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336765 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336765 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336765 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336765 precursor RNA is designated SEQ ID:7261, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7261 is located from position 42908013 to position 42908088 relative to chromosome 20 on the `+` strand.

GAM336765 precursor RNA folds onto itself, forming GAM336765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336765 precursor RNA, designated SEQ ID NO: 7261, and a schematic representation of a predicted secondary folding of GAM336765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336765 folded precursor RNA yielding a GAM336765 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336765 RNA, hereby incorporated herein.

GAM336765 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336765 target RNA, herein designated GAM TARGET RNA.

GAM336765 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336765 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336765 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336765 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336765 RNA, herein designated GAM RNA, to target binding sites on GAM336765 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336765 target RNA into GAM336765 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336765 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336765 target genes. The mRNA of each one of this plurality of GAM336765 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336765 RNA, herein designated GAM RNA, and which when bound by GAM336765 RNA causes inhibition of translation of the GAM336765 target mRNA into a corresponding GAM336765 target protein.

The mechanism of the translational inhibition exerted by GAM336765 RNA, herein designated GAM RNA, on one or more GAM336765 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336765 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336765 RNA, herein designated GAM RNA, of GAM336765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336765 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336765 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336765 RNA correlate with, and may be deduced from, the identity of the GAM336765 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336767 6780 GGGACCGTTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTGAAATGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTTGATTTT Messenger 336767 (GAM336767) oligonucleotides modulates expression of respective target

AGTGGCTGTG genes whose function and utility is known in the art.

AGCACACATA GAM336767 is a novel bioinformatically detectable regulatory, non protein

AGGATACAGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336767 was detected

TCATTTCCCT is described with additional reference to Figs. 9-15.

TATAATTAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCC encoded by the human genome.

GAM336767 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336767 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336767 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336767 precursor RNA is designated SEQ ID:6780, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6780 is located from position 43301518 to position 43301601 relative to chromosome 13 on the `+` strand.

GAM336767 precursor RNA folds onto itself, forming GAM336767 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336767 precursor RNA, designated SEQ ID NO: 6780, and a schematic representation of a predicted secondary folding of GAM336767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336767 folded precursor RNA yielding a GAM336767 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336767 RNA, hereby incorporated herein.

GAM336767 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336767 target RNA, herein designated GAM TARGET RNA.

GAM336767 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336767 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336767 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336767 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336767 RNA, herein designated GAM RNA, to target binding sites on GAM336767 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336767 target RNA into GAM336767 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336767 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336767 target genes. The mRNA of each one of this plurality of GAM336767 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336767 RNA,

herein designated GAM RNA, and which when bound by GAM336767 RNA causes inhibition of translation of the GAM336767 target mRNA into a corresponding GAM336767 target protein.

The mechanism of the translational inhibition exerted by GAM336767 RNA, herein designated GAM RNA, on one or more GAM336767 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336767 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336767 RNA, herein designated GAM RNA, of GAM336767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336767 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336767 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336767 RNA correlate with, and may be deduced from, the identity of the GAM336767 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336768 6434 GAGGCATAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTCGGGAGG Messenger 336768 (GAM336768) oligonucleotides modulates expression of respective target

TGGAGGTTGC genes whose function and utility is known in the art.

AGTGAGCCAA GAM336768 is a novel bioinformatically detectable regulatory, non protein

GATCACACCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336768 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGTGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGCAAGACT encoded by the human genome.

CTGTCTC GAM336768 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336768 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336768 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336768 precursor RNA is designated SEQ ID:6434, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6434 is located from position 43393809 to position 43393905 relative to chromosome 17 on the `-` strand.

GAM336768 precursor RNA folds onto itself, forming GAM336768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336768 precursor RNA, designated SEQ ID NO: 6434, and a schematic representation of a predicted secondary folding of GAM336768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336768 folded precursor RNA yielding a GAM336768 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336768 RNA, hereby incorporated herein.

GAM336768 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336768 target RNA, herein designated GAM TARGET RNA.

GAM336768 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336768 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336768 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336768 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336768 RNA, herein designated GAM RNA, to target binding sites on GAM336768 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336768 target RNA

into GAM336768 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336768 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336768 target genes. The mRNA of each one of this plurality of GAM336768 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336768 RNA, herein designated GAM RNA, and which when bound by GAM336768 RNA causes inhibition of translation of the GAM336768 target mRNA into a corresponding GAM336768 target protein.

The mechanism of the translational inhibition exerted by GAM336768 RNA, herein designated GAM RNA, on one or more GAM336768 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336768 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336768 RNA, herein designated GAM RNA, of GAM336768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336768 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336768 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336768 RNA correlate with, and may be deduced from, the identity of the GAM336768 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336770 6988 TCAAGTCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACTGCTCAA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCAGTGACC Messenger 336770 (GAM336770) oligonucleotides modulates expression of respective target

ACTAGCCATA genes whose function and utility is known in the art.

TGTGGCTACT GAM336770 is a novel bioinformatically detectable regulatory, non protein

GAGCACTTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336770 was detected

AATGTGGCTA is described with additional reference to Figs. 9-15.

GTTTGAACTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGATGTGCTC encoded by the human genome.

TAAGTACACT GAM336770 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGATTTTGA GAM336770 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336770 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336770 precursor RNA is designated SEQ ID:6988, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6988 is located from position 43586567 to position 43586675 relative to chromosome 13 on the `+` strand.

GAM336770 precursor RNA folds onto itself, forming GAM336770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336770 precursor RNA, designated SEQ ID NO: 6988, and a schematic representation of a predicted secondary folding of GAM336770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336770 folded precursor RNA yielding a GAM336770 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336770 RNA, hereby incorporated herein.

GAM336770 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336770 target RNA, herein designated GAM TARGET RNA.

GAM336770 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336770 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336770 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336770 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336770 RNA, herein designated GAM RNA, to target binding sites on GAM336770 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336770 target RNA into GAM336770 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336770 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336770 target genes. The mRNA of each one of this plurality of GAM336770 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336770 RNA, herein designated GAM RNA, and which when bound by GAM336770 RNA causes inhibition of translation of the GAM336770 target mRNA into a corresponding GAM336770 target protein.

The mechanism of the translational inhibition exerted by GAM336770 RNA, herein designated GAM RNA, on one or more GAM336770 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336770 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336770 RNA, herein designated GAM RNA, of GAM336770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336770 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336770 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336770 RNA correlate with, and may be deduced from, the identity of the GAM336770 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336771 6882 GTCCTGTACT Fig. 8 further provides a conceptual description of another novel bioinformatically

GCTCAATTCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGACCACTA Messenger 336771 (GAM336771) oligonucleotides modulates expression of respective target

GCCATATGTG genes whose function and utility is known in the art.

GCTACTGAGC GAM336771 is a novel bioinformatically detectable regulatory, non protein
ACTTGAAATG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336771 was detected
TGGCTAGTTT is described with additional reference to Figs. 9-15.

GAACTGAGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTGCTCTAAG encoded by the human genome.

TACACTGGAT GAM336771 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336771 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336771 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336771 precursor RNA is designated SEQ ID:6882, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6882 is located from position 43586571 to position 43586670 relative to chromosome 13 on the `+` strand.

GAM336771 precursor RNA folds onto itself, forming GAM336771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336771 precursor RNA, designated SEQ ID NO: 6882, and a schematic representation of a predicted secondary folding of GAM336771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336771 folded precursor RNA yielding a GAM336771 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336771 RNA, hereby incorporated herein.

GAM336771 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336771 target RNA, herein designated GAM TARGET RNA.

GAM336771 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336771 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336771 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336771 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336771 RNA, herein designated GAM RNA, to target binding sites on GAM336771 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336771 target RNA into GAM336771 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336771 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336771 target genes. The mRNA of each one of this plurality of GAM336771 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336771 RNA, herein designated GAM RNA, and which when bound by GAM336771 RNA causes inhibition of translation of the GAM336771 target mRNA into a corresponding GAM336771 target protein.

The mechanism of the translational inhibition exerted by GAM336771 RNA, herein designated GAM RNA, on one or more GAM336771 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336771 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336771 RNA, herein designated GAM RNA, of GAM336771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336771 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336771 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336771 RNA correlate with, and may be deduced from, the identity of the GAM336771 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336772 6624 GGAGAATCAT Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAGCCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAGCAGAGG Messenger 336772 (GAM336772) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCAAGATCAC GAM336772 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336772 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336772 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336772 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336772 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336772 precursor RNA is designated SEQ ID:6624, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6624 is located from position 43590234 to position 43590321 relative to chromosome 5 on the `-` strand.

GAM336772 precursor RNA folds onto itself, forming GAM336772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336772 precursor RNA, designated SEQ ID NO: 6624, and a schematic representation of a predicted secondary folding of GAM336772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336772 folded precursor RNA yielding a GAM336772 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336772 RNA, hereby incorporated herein. Expression of GAM336772 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336772 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336772 target RNA, herein designated GAM TARGET RNA.

GAM336772 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336772 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336772 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336772 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336772 RNA, herein designated GAM RNA, to target binding sites on GAM336772 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336772 target RNA into GAM336772 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336772 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336772 target genes. The mRNA of each one of this plurality of GAM336772 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336772 RNA, herein designated GAM RNA, and which when bound by GAM336772 RNA causes inhibition of translation of the GAM336772 target mRNA into a corresponding GAM336772 target protein.

The mechanism of the translational inhibition exerted by GAM336772 RNA, herein designated GAM RNA, on one or more GAM336772 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336772 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336772 RNA, herein designated GAM RNA, of GAM336772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336772 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336772 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336772 RNA correlate with, and may be deduced from, the identity of the GAM336772 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336773 6862 GTAGAGGGTA TGCCTGGGAA AACAGGAGTC ACAGAAGCTT CTGTGACTGT ATTTTCCCAA AGAGGTTTAT TATTTAT

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336773 (GAM336773) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336773 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336773 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336773 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336773 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336773 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336773 precursor RNA is designated SEQ ID:6862, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6862 is located from position 43594076 to position 43594152 relative to chromosome 7 on the `+` strand.

GAM336773 precursor RNA folds onto itself, forming GAM336773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336773 precursor RNA, designated SEQ ID NO: 6862, and a schematic representation of a predicted secondary folding of GAM336773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336773 folded precursor RNA yielding a GAM336773 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336773 RNA, hereby incorporated herein.

GAM336773 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336773 target RNA, herein designated GAM TARGET RNA.

GAM336773 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336773 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336773 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336773 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336773 RNA, herein designated GAM RNA, to target binding sites on GAM336773 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336773 target RNA into GAM336773 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336773 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336773 target genes. The mRNA of each one of this plurality of GAM336773 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336773 RNA, herein designated GAM RNA, and which when bound by GAM336773 RNA causes inhibition of translation of the GAM336773 target mRNA into a corresponding GAM336773 target protein.

The mechanism of the translational inhibition exerted by GAM336773 RNA, herein designated GAM RNA, on one or more GAM336773 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336773 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336773 RNA, herein designated GAM RNA, of GAM336773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336773 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336773 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336773 RNA correlate with, and may be deduced from, the identity of the GAM336773 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336775 6912 GTGGCATAGG Fig. 8 further provides a conceptual description of another novel bioinformatically
GTGGGCCTTT detected oligonucleotides of the present invention, referred to here as Genomic Address
AATCCAATGT Messenger 336775 (GAM336775) oligonucleotides modulates expression of respective target
GACTGGTGTC genes whose function and utility is known in the art.

CATATAAGAG GAM336775 is a novel bioinformatically detectable regulatory, non protein
GTGGAGAAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336775 was detected
GTAGAGACAC is described with additional reference to Figs. 9-15.

AGACACATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGAAGGCCA encoded by the human genome.

TGTGATGGCA GAM336775 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
C GAM336775 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336775 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336775 precursor RNA is designated SEQ ID:6912, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6912 is located from position 43900231 to position 43900331 relative to chromosome 10 on the `+` strand.

GAM336775 precursor RNA folds onto itself, forming GAM336775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336775 precursor RNA, designated SEQ ID NO: 6912, and a schematic representation of a predicted secondary folding of GAM336775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336775 folded precursor RNA yielding a GAM336775 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336775 RNA, hereby incorporated herein.

GAM336775 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336775 target RNA, herein designated GAM TARGET RNA.

GAM336775 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336775 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336775 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336775 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336775 RNA, herein designated GAM RNA, to target binding sites on GAM336775 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336775 target RNA into GAM336775 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336775 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336775 target genes. The mRNA of each one of this plurality of GAM336775 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336775 RNA, herein designated GAM RNA, and which when bound by GAM336775 RNA causes inhibition of translation of the GAM336775 target mRNA into a corresponding GAM336775 target protein.

The mechanism of the translational inhibition exerted by GAM336775 RNA, herein

designated GAM RNA, on one or more GAM336775 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336775 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336775 RNA, herein designated GAM RNA, of GAM336775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336775 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336775 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336775 RNA correlate with, and may be deduced from, the identity of the GAM336775 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336776 6978 TAGTGTTCAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GACCTACACT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCATCCTCCT Messenger 336776 (GAM336776) oligonucleotides modulates expression of respective target

TTAATTTGCC genes whose function and utility is known in the art.

CAGTGGCCTG GAM336776 is a novel bioinformatically detectable regulatory, non protein

ACACTTGGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336776 was detected

GGGCAAGTGC is described with additional reference to Figs. 9-15.

TGTCATATGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGATCTGTT encoded by the human genome.

TACGTGAACA GAM336776 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TTA GAM336776 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336776 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336776 precursor RNA is designated SEQ ID:6978, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6978 is located from position 44128391 to position 44128493 relative to chromosome 17 on the `+` strand.

GAM336776 precursor RNA folds onto itself, forming GAM336776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336776 precursor RNA, designated SEQ ID NO: 6978, and a schematic representation of a predicted secondary folding of GAM336776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336776 folded precursor RNA yielding a GAM336776 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336776 RNA, hereby incorporated herein.

GAM336776 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336776 target RNA, herein designated GAM TARGET RNA.

GAM336776 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336776 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336776 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336776 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336776 RNA, herein designated GAM RNA, to target binding sites on GAM336776 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336776 target RNA into GAM336776 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336776 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336776 target genes. The mRNA of each one of this plurality of GAM336776 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336776 RNA, herein designated GAM RNA, and which when bound by GAM336776 RNA causes inhibition of translation of the GAM336776 target mRNA into a corresponding GAM336776 target protein.

The mechanism of the translational inhibition exerted by GAM336776 RNA, herein designated GAM RNA, on one or more GAM336776 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336776 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336776 RNA, herein designated GAM RNA, of GAM336776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336776 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336776 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336776 RNA correlate with, and may be deduced from, the identity of the GAM336776 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336777 5864 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336777 (GAM336777) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336777 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336777 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336777 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336777 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336777 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336777 precursor RNA is designated SEQ ID:5864, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5864 is located from position 44151668 to position 44151749 relative to chromosome 12 on the `+` strand.

GAM336777 precursor RNA folds onto itself, forming GAM336777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336777 precursor RNA, designated SEQ ID NO: 5864, and a schematic representation of a predicted secondary folding of GAM336777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336777 folded precursor RNA yielding a GAM336777 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336777 RNA, hereby incorporated herein.

GAM336777 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336777 target RNA, herein designated GAM TARGET RNA.

GAM336777 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336777 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336777 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336777 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336777 RNA, herein designated GAM RNA, to target binding sites on GAM336777 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336777 target RNA into GAM336777 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336777 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336777 target genes. The mRNA of each one of this plurality of GAM336777 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336777 RNA, herein designated GAM RNA, and which when bound by GAM336777 RNA causes inhibition of translation of the GAM336777 target mRNA into a corresponding GAM336777 target protein.

The mechanism of the translational inhibition exerted by GAM336777 RNA, herein designated GAM RNA, on one or more GAM336777 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336777 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336777 RNA, herein designated GAM RNA, of GAM336777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336777 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336777 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336777 RNA correlate with, and may be deduced from, the identity of the GAM336777 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336778 7013 TCATACTGTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GCATGAAAAG Messenger 336778 (GAM336778) oligonucleotides modulates expression of respective target

CTCTGTGGTG genes whose function and utility is known in the art.

CAGTGGCAAA GAM336778 is a novel bioinformatically detectable regulatory, non protein

CAGGGCTAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336778 was detected

GATGTTTGCT is described with additional reference to Figs. 9-15.

GATGTCGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGA encoded by the human genome.

GAM336778 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336778 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336778 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336778 precursor RNA is designated SEQ ID:7013, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7013 is located from position 44172084 to position 44172167 relative to chromosome 10 on the `+` strand.

GAM336778 precursor RNA folds onto itself, forming GAM336778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336778 precursor RNA, designated SEQ ID NO: 7013, and a schematic representation of a predicted secondary folding of GAM336778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336778 folded precursor RNA yielding a GAM336778 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336778 RNA, hereby incorporated herein.

GAM336778 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336778 target RNA, herein designated GAM TARGET RNA.

GAM336778 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336778 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336778 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336778 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336778 RNA, herein designated GAM RNA, to target binding sites on GAM336778 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336778 target RNA into GAM336778 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336778 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336778 target genes. The mRNA of each one of this plurality of GAM336778 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336778 RNA, herein designated GAM RNA, and which when bound by GAM336778 RNA causes inhibition of translation of the GAM336778 target mRNA into a corresponding GAM336778 target protein.

The mechanism of the translational inhibition exerted by GAM336778 RNA, herein designated GAM RNA, on one or more GAM336778 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336778 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336778 RNA, herein designated GAM RNA, of GAM336778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336778 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336778 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336778 RNA correlate with, and may be deduced from, the identity of the GAM336778 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GGTGATGAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTATGTGACC encoded by the human genome.

CCTCT GAM336781 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336781 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336781 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336781 precursor RNA is designated SEQ ID:5750, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5750 is located from position 44376402 to position 44376496 relative to chromosome 21 on the `+` strand.

GAM336781 precursor RNA folds onto itself, forming GAM336781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336781 precursor RNA, designated SEQ ID NO: 5750, and a schematic representation of a predicted secondary folding of GAM336781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336781 folded precursor RNA yielding a GAM336781 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336781 RNA, hereby incorporated herein.

GAM336781 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336781 target RNA, herein designated GAM TARGET RNA.

GAM336781 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336781 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336781 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336781 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336781 RNA, herein designated GAM RNA, to target binding sites on GAM336781 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336781 target RNA into GAM336781 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336781 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336781 target genes. The mRNA of each one of this plurality of GAM336781 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336781 RNA, herein designated GAM RNA, and which when bound by GAM336781 RNA causes inhibition of translation of the GAM336781 target mRNA into a corresponding GAM336781 target protein.

The mechanism of the translational inhibition exerted by GAM336781 RNA, herein designated GAM RNA, on one or more GAM336781 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336781 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336781 RNA, herein designated GAM RNA, of GAM336781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336781 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336781 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336781 RNA correlate with, and may be deduced from, the identity of the GAM336781 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336782 6821 GGGTCACTGT Fig. 8 further provides a conceptual description of another novel bioinformatically
ATGGTACCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTCAGCTTC Messenger 336782 (GAM336782) oligonucleotides modulates expression of respective target
CTGTGTTACA genes whose function and utility is known in the art.

CGAGATGGCA GAM336782 is a novel bioinformatically detectable regulatory, non protein
CAGTTGGGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336782 was detected
AAGCTGGTGA is described with additional reference to Figs. 9-15.

TGAAGGTATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGACCC encoded by the human genome.

GAM336782 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336782 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336782 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336782 precursor RNA is designated SEQ ID:6821, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6821 is located from position 44376407 to position 44376492 relative to chromosome 21 on the `+` strand.

GAM336782 precursor RNA folds onto itself, forming GAM336782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336782 precursor RNA, designated SEQ ID NO: 6821, and a schematic representation of a predicted secondary folding of GAM336782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336782 folded precursor RNA yielding a GAM336782 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336782 RNA, hereby incorporated herein.

GAM336782 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336782 target RNA, herein designated GAM TARGET RNA.

GAM336782 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336782 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336782 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336782 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336782 RNA, herein designated GAM RNA, to target binding sites on GAM336782 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336782 target RNA into GAM336782 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336782 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336782 target genes. The mRNA of each one of this plurality of GAM336782 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336782 RNA, herein designated GAM RNA, and which when bound by GAM336782 RNA causes inhibition of translation of the GAM336782 target mRNA into a corresponding GAM336782 target protein.

The mechanism of the translational inhibition exerted by GAM336782 RNA, herein designated GAM RNA, on one or more GAM336782 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336782 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336782 RNA, herein designated GAM RNA, of GAM336782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336782 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336782 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336782 RNA correlate with, and may be deduced from, the identity of the GAM336782 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336783 6287 GAACATCCAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCTGGGGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAACCTGGC Messenger 336783 (GAM336783) oligonucleotides modulates expression of respective target

ATACAATGTA genes whose function and utility is known in the art.

GATTTCTGTG GAM336783 is a novel bioinformatically detectable regulatory, non protein

TTCGTTAGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336783 was detected

AACAGCTACA is described with additional reference to Figs. 9-15.

TTGTCTGCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTTTCAGGC encoded by the human genome.

TACCTGGAAA GAM336783 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CATGTTC GAM336783 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336783 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336783 precursor RNA is designated SEQ ID:6287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6287 is located from position 44431916 to position 44432022 relative to chromosome X on the `-` strand.

GAM336783 precursor RNA folds onto itself, forming GAM336783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336783 precursor RNA, designated SEQ ID NO: 6287, and a schematic representation of a predicted secondary folding of GAM336783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336783 folded precursor RNA yielding a GAM336783 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336783 RNA, hereby incorporated herein.

GAM336783 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336783 target RNA, herein designated GAM TARGET RNA.

GAM336783 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336783 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336783 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336783 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336783 RNA, herein designated GAM RNA, to target binding sites on GAM336783 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336783 target RNA into GAM336783 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336783 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336783 target genes. The mRNA of each one of this plurality of GAM336783 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336783 RNA, herein designated GAM RNA, and which when bound by GAM336783 RNA causes inhibition of translation of the GAM336783 target mRNA into a corresponding GAM336783 target protein.

The mechanism of the translational inhibition exerted by GAM336783 RNA, herein designated GAM RNA, on one or more GAM336783 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336783 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336783 RNA, herein designated GAM RNA, of GAM336783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336783 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336783 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336783 RNA correlate with, and may be deduced from, the identity of the GAM336783 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336784 7021 TCCAGGTCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGCATGAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTGGCATACA Messenger 336784 (GAM336784) oligonucleotides modulates expression of respective target

ATGTAGATTT genes whose function and utility is known in the art.

CTGTGTTCGT GAM336784 is a novel bioinformatically detectable regulatory, non protein

TAGGCAACAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336784 was detected

CTACATTGTC is described with additional reference to Figs. 9-15.

TGCTGGGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGGCTACCT encoded by the human genome.

GGA GAM336784 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336784 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336784 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336784 precursor RNA is designated SEQ

ID:7021, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7021 is located from position 44431925 to position 44432017 relative to chromosome X on the `-` strand.

GAM336784 precursor RNA folds onto itself, forming GAM336784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336784 precursor RNA, designated SEQ ID NO: 7021, and a schematic representation of a predicted secondary folding of GAM336784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336784 folded precursor RNA yielding a GAM336784 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336784 RNA, hereby incorporated herein.

GAM336784 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336784 target RNA, herein designated GAM TARGET RNA.

GAM336784 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336784 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336784 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336784 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336784 RNA, herein designated GAM RNA, to target binding sites on GAM336784 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336784 target RNA into GAM336784 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336784 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336784 target genes. The mRNA of each one of this plurality of GAM336784 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336784 RNA, herein designated GAM RNA, and which when bound by GAM336784 RNA causes inhibition of translation of the GAM336784 target mRNA into a corresponding GAM336784 target protein.

The mechanism of the translational inhibition exerted by GAM336784 RNA, herein designated GAM RNA, on one or more GAM336784 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336784 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336784 RNA, herein designated GAM RNA, of GAM336784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336784 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336784 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336784 RNA correlate with, and may be deduced from, the identity of the GAM336784 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336785 7265 TGTCTATAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTATGTGGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CATTTTCTGC Messenger 336785 (GAM336785) oligonucleotides modulates expression of respective target

CCGTAAAATG genes whose function and utility is known in the art.

TTCAAATGTT GAM336785 is a novel bioinformatically detectable regulatory, non protein

TTCTCTCTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336785 was detected

AAAGCTTTGT is described with additional reference to Figs. 9-15.

TCATTGTATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTGGAATT encoded by the human genome.

TTGGTTCTCA GAM336785 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGGAGTAGAC GAM336785 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

A GAM336785 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336785 precursor RNA is designated SEQ ID:7265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7265 is located from position 44596378 to position 44596488 relative to chromosome 17 on the `+` strand.

GAM336785 precursor RNA folds onto itself, forming GAM336785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336785 precursor RNA, designated SEQ ID NO: 7265, and a schematic representation of a predicted secondary folding of GAM336785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336785 folded precursor RNA yielding a GAM336785 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM336785 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336785 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM336785 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336785 target RNA, herein designated GAM TARGET RNA.

GAM336785 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336785 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336785 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336785 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336785 RNA, herein designated GAM RNA, to target binding sites on GAM336785 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336785 target RNA into GAM336785 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336785 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336785 target genes. The mRNA of each one of this plurality of GAM336785 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336785 RNA, herein designated GAM RNA, and which when bound by GAM336785 RNA causes inhibition of translation of the GAM336785 target mRNA into a corresponding GAM336785 target protein.

The mechanism of the translational inhibition exerted by GAM336785 RNA, herein designated GAM RNA, on one or more GAM336785 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336785 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336785 RNA, herein designated GAM RNA, of GAM336785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336785 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336785 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336785 RNA correlate with, and may be deduced from, the identity of the GAM336785 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336786 5865 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336786 (GAM336786) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336786 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336786 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336786 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336786 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336786 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336786 precursor RNA is designated SEQ ID:5865, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5865 is located from position 44812786 to position 44812867 relative to chromosome 10 on the `+` strand.

GAM336786 precursor RNA folds onto itself, forming GAM336786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336786 precursor RNA, designated SEQ ID NO: 5865, and a schematic representation of a predicted secondary folding of GAM336786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336786 folded precursor RNA yielding a GAM336786 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336786 RNA, hereby incorporated herein.

GAM336786 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336786 target RNA, herein designated GAM TARGET RNA.

GAM336786 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336786 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336786 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336786 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336786 RNA, herein designated GAM RNA, to target binding sites on GAM336786 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336786 target RNA into GAM336786 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336786 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336786 target genes. The mRNA of each one of this plurality of GAM336786 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336786 RNA, herein designated GAM RNA, and which when bound by GAM336786 RNA causes inhibition of translation of the GAM336786 target mRNA into a corresponding GAM336786 target protein.

The mechanism of the translational inhibition exerted by GAM336786 RNA, herein designated GAM RNA, on one or more GAM336786 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336786 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336786 RNA, herein designated GAM RNA, of GAM336786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336786 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336786 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336786 RNA correlate with, and may be deduced from, the identity of the GAM336786 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336787 5763 AGGCAAGGTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCACTCGGTC detected oligonucleotides of the present invention, referred to here as Genomic Address
ATCCAGGTTG Messenger 336787 (GAM336787) oligonucleotides modulates expression of respective target

GTGTGATCAC GAM336787 is a novel bioinformatically detectable regulatory, non protein
AGTTCACTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336787 was detected
AAACTCAAAC is described with additional reference to Figs. 9-15.

TCCTGGGCTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGGAATCTT encoded by the human genome.

CCT GAM336787 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336787 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336787 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336787 precursor RNA is designated SEQ ID:5763, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5763 is located from position 44900341 to position 44900433 relative to chromosome 22 on the `+` strand.

GAM336787 precursor RNA folds onto itself, forming GAM336787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336787 precursor RNA, designated SEQ ID NO: 5763, and a schematic representation of a predicted secondary folding of GAM336787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336787 folded precursor RNA yielding a GAM336787 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336787 RNA, hereby incorporated herein.

GAM336787 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336787 target RNA, herein designated GAM TARGET RNA.

GAM336787 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336787 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336787 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336787 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336787 RNA, herein designated GAM RNA, to target binding sites on GAM336787 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336787 target RNA into GAM336787 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336787 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336787 target genes. The mRNA of each one of this plurality of GAM336787 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336787 RNA, herein designated GAM RNA, and which when bound by GAM336787 RNA causes inhibition of translation of the GAM336787 target mRNA into a corresponding GAM336787 target protein.

The mechanism of the translational inhibition exerted by GAM336787 RNA, herein designated GAM RNA, on one or more GAM336787 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336787 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336787 RNA, herein designated GAM RNA, of GAM336787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336787 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336787 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336787 RNA correlate with, and may be deduced from, the identity of the GAM336787 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336788 6834 GGTATTGGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTCTTCCTT GAM336788 is a novel bioinformatically detectable regulatory, non protein
TCATGACAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336788 was detected
ACCCATAGAC is described with additional reference to Figs. 9-15.

ACTTAGTCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTGACT encoded by the human genome.

GAM336788 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336788 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336788 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336788 precursor RNA is designated SEQ ID:6834, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6834 is located from position 44989605 to position 44989690 relative to chromosome 20 on the `+` strand.

GAM336788 precursor RNA folds onto itself, forming GAM336788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336788 precursor RNA, designated SEQ ID NO: 6834, and a schematic representation of a predicted secondary folding of GAM336788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336788 folded precursor RNA yielding a GAM336788 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336788 RNA, hereby incorporated herein.

GAM336788 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336788 target RNA, herein designated GAM TARGET RNA.

GAM336788 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336788 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336788 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336788 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336788 RNA, herein designated GAM RNA, to target binding sites on GAM336788 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336788 target RNA into GAM336788 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336788 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336788 target genes. The mRNA of each one of this plurality of GAM336788 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336788 RNA, herein designated GAM RNA, and which when bound by GAM336788 RNA causes inhibition of translation of the GAM336788 target mRNA into a corresponding GAM336788 target protein.

The mechanism of the translational inhibition exerted by GAM336788 RNA, herein designated GAM RNA, on one or more GAM336788 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336788 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336788 RNA, herein designated GAM RNA, of GAM336788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336788 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336788 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336788 RNA correlate with, and may be deduced from, the identity of the GAM336788 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336789 6435 GAGGCCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCCTTCCTCT is described with additional reference to Figs. 9-15.

TCTGCCATGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTATAAGTTT encoded by the human genome.

CCTGAGGCCT GAM336789 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
C GAM336789 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336789 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336789 precursor RNA is designated SEQ ID:6435, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6435 is located from position 45081110 to position 45081210 relative to chromosome 21 on the `+` strand.

GAM336789 precursor RNA folds onto itself, forming GAM336789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336789 precursor RNA, designated SEQ ID NO: 6435, and a schematic representation of a predicted secondary folding of GAM336789 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336789 folded precursor RNA yielding a GAM336789 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336789 RNA, hereby incorporated herein.

GAM336789 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336789 target RNA, herein designated GAM TARGET RNA.

GAM336789 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336789 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336789 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336789 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336789 RNA, herein designated GAM RNA, to target binding sites on GAM336789 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336789 target RNA into GAM336789 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336789 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336789 target genes. The mRNA of each one of this plurality of GAM336789 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336789 RNA, herein designated GAM RNA, and which when bound by GAM336789 RNA causes inhibition of translation of the GAM336789 target mRNA into a corresponding GAM336789 target protein.

The mechanism of the translational inhibition exerted by GAM336789 RNA, herein designated GAM RNA, on one or more GAM336789 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336789 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336789 RNA, herein designated GAM RNA, of GAM336789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336789 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336789 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336789 RNA correlate with, and may be deduced from, the identity of the GAM336789 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGGCAGGGAG GAM336792 is a novel bioinformatically detectable regulatory, non protein

GAGAAGGAAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336792 was detected

CTGCTCTGTG is described with additional reference to Figs. 9-15.

CTTATTCTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCCCGTTTC encoded by the human genome.

TTTTGCAGCC GAM336792 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TGCCCACGGC GAM336792 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

TT GAM336792 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336792 precursor RNA is designated SEQ ID:5775, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5775 is located from position 45455573 to position 45455684 relative to chromosome 19 on the `-` strand.

GAM336792 precursor RNA folds onto itself, forming GAM336792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336792 precursor RNA, designated SEQ ID NO: 5775, and a schematic representation of a predicted secondary folding of GAM336792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336792 folded precursor RNA yielding a GAM336792 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336792 RNA, hereby incorporated herein.

GAM336792 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336792 target RNA, herein designated GAM TARGET RNA.

GAM336792 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336792 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336792 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336792 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336792 RNA, herein designated GAM RNA, to target binding sites on GAM336792 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336792 target RNA into GAM336792 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336792 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336792 target genes. The mRNA of each one of this plurality of GAM336792 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336792 RNA, herein designated GAM RNA, and which when bound by GAM336792 RNA causes inhibition of translation of the GAM336792 target mRNA into a corresponding GAM336792 target protein.

The mechanism of the translational inhibition exerted by GAM336792 RNA, herein designated GAM RNA, on one or more GAM336792 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336792 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336792 RNA, herein designated GAM RNA, of GAM336792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336792 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336792 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336792 RNA correlate with, and may be deduced from, the identity of the GAM336792 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336793 7248 TGGGTGGCGT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGGGGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGTGTGTGT Messenger 336793 (GAM336793) oligonucleotides modulates expression of respective target

GGGGTGGCAG genes whose function and utility is known in the art.

GGAGGAGAAG GAM336793 is a novel bioinformatically detectable regulatory, non protein

GAATCTGCTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336793 was detected

TGTGCTTATT is described with additional reference to Figs. 9-15.

CTTGTCCCCG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTCTTTTGC encoded by the human genome.

AGCCTGCCCA GAM336793 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336793 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336793 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336793 precursor RNA is designated SEQ ID:7248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7248 is located from position 45455579 to position 45455678 relative to chromosome 19 on the `-` strand.

GAM336793 precursor RNA folds onto itself, forming GAM336793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336793 precursor RNA, designated SEQ ID NO: 7248, and a schematic representation of a predicted secondary folding of GAM336793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336793 folded precursor RNA yielding a GAM336793 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336793 RNA, hereby incorporated herein.

GAM336793 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336793 target RNA, herein designated GAM TARGET RNA.

GAM336793 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336793 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336793 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336793 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336793 RNA, herein designated GAM RNA, to target binding sites on GAM336793 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336793 target RNA into GAM336793 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336793 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336793 target genes. The mRNA of each one of this plurality of GAM336793 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336793 RNA, herein designated GAM RNA, and which when bound by GAM336793 RNA causes inhibition of translation of the GAM336793 target mRNA into a corresponding GAM336793 target protein.

The mechanism of the translational inhibition exerted by GAM336793 RNA, herein designated GAM RNA, on one or more GAM336793 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336793 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336793 RNA, herein designated GAM RNA, of GAM336793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336793 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336793 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336793 RNA correlate with, and may be deduced from, the identity of the GAM336793 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336794 7251 TGGTGGAAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAACCTGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTCCAAGGA Messenger 336794 (GAM336794) oligonucleotides modulates expression of respective target

CAGTCCCATG genes whose function and utility is known in the art.

ACAGGGAAGC GAM336794 is a novel bioinformatically detectable regulatory, non protein
TGACACTTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336794 was detected
GTGGCAGGTT is described with additional reference to Figs. 9-15.

AATCCCCCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336794 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336794 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336794 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336794 precursor RNA is designated SEQ ID:7251, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7251 is located from position 45732059 to position 45732138 relative to chromosome 10 on the `+` strand.

GAM336794 precursor RNA folds onto itself, forming GAM336794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336794 precursor RNA, designated SEQ ID NO: 7251, and a schematic representation of a predicted secondary folding of GAM336794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336794 folded precursor RNA yielding a GAM336794 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336794 RNA, hereby incorporated herein.

GAM336794 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336794 target RNA, herein designated GAM TARGET RNA.

GAM336794 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336794 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336794 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the

nucleotide sequence of GAM336794 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336794 RNA, herein designated GAM RNA, to target binding sites on GAM336794 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336794 target RNA into GAM336794 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336794 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336794 target genes. The mRNA of each one of this plurality of GAM336794 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336794 RNA, herein designated GAM RNA, and which when bound by GAM336794 RNA causes inhibition of translation of the GAM336794 target mRNA into a corresponding GAM336794 target protein.

The mechanism of the translational inhibition exerted by GAM336794 RNA, herein designated GAM RNA, on one or more GAM336794 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336794 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336794 RNA, herein designated GAM RNA, of GAM336794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336794 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336794 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336794 RNA correlate with, and may be deduced from, the identity of the GAM336794 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336795 7073 TCTGCCAGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTATGCCAC detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTGGCTCTG Messenger 336795 (GAM336795) oligonucleotides modulates expression of respective target

TGCTTCTAGT genes whose function and utility is known in the art.

ATCTGCATTT GAM336795 is a novel bioinformatically detectable regulatory, non protein

AATGCTTAGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336795 was detected

TTCTACCAGA is described with additional reference to Figs. 9-15.

GCTAGTTTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GCACAAAGTT encoded by the human genome.

TCCAGA GAM336795 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336795 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336795 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336795 precursor RNA is designated SEQ ID:7073, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7073 is located from position 45867956 to position 45868051 relative to chromosome 22 on the `+` strand.

GAM336795 precursor RNA folds onto itself, forming GAM336795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336795 precursor RNA, designated SEQ ID NO: 7073, and a schematic representation of a predicted secondary folding of GAM336795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336795 folded precursor RNA yielding a GAM336795 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336795 RNA, hereby incorporated herein.

GAM336795 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336795 target RNA, herein designated GAM TARGET RNA.

GAM336795 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336795 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336795 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336795 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336795 RNA, herein designated GAM RNA, to target binding sites on GAM336795 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336795 target RNA into GAM336795 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336795 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336795 target genes. The mRNA of each one of this plurality of GAM336795 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336795 RNA, herein designated GAM RNA, and which when bound by GAM336795 RNA causes inhibition of translation of the GAM336795 target mRNA into a corresponding GAM336795 target protein.

The mechanism of the translational inhibition exerted by GAM336795 RNA, herein designated GAM RNA, on one or more GAM336795 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336795 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336795 RNA, herein designated GAM RNA, of GAM336795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336795 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336795 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336795 RNA correlate with, and may be deduced from, the identity of the GAM336795 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336796 5977 ATGTTCTGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAGGGCTTC Messenger 336796 (GAM336796) oligonucleotides modulates expression of respective target
AACTTACGAA genes whose function and utility is known in the art.

TTTGGTGAGT GAM336796 is a novel bioinformatically detectable regulatory, non protein
TCACAGTTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336796 was detected
GCCTGTAACA is described with additional reference to Figs. 9-15.

CATTTCTTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGATTTCCAG encoded by the human genome.

AGCGT GAM336796 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336796 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336796 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336796 precursor RNA is designated SEQ ID:5977, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5977 is located from position 45983536 to position 45983630 relative to chromosome 18 on the `+` strand.

GAM336796 precursor RNA folds onto itself, forming GAM336796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336796 precursor RNA, designated SEQ ID NO: 5977, and a schematic representation of a predicted secondary folding of GAM336796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336796 folded precursor RNA yielding a GAM336796 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336796 RNA, hereby incorporated herein.

GAM336796 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336796 target RNA, herein designated GAM TARGET RNA.

GAM336796 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336796 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336796 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336796 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336796 RNA, herein designated GAM RNA, to target binding sites on GAM336796 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336796 target RNA into GAM336796 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336796 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336796 target genes. The mRNA of each one of this plurality of GAM336796 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336796 RNA, herein designated GAM RNA, and which when bound by GAM336796 RNA causes inhibition of translation of the GAM336796 target mRNA into a corresponding GAM336796 target protein.

The mechanism of the translational inhibition exerted by GAM336796 RNA, herein designated GAM RNA, on one or more GAM336796 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336796 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336796 RNA, herein designated GAM RNA, of

GAM336796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336796 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336796 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336796 RNA correlate with, and may be deduced from, the identity of the GAM336796 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336797 7297 TTCATTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGTCAGGAC Messenger 336797 (GAM336797) oligonucleotides modulates expression of respective target

ATGGGTATCT genes whose function and utility is known in the art.

GGTGTACATG GAM336797 is a novel bioinformatically detectable regulatory, non protein

GGAGTTTGGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336797 was detected

GGCCTCTATT is described with additional reference to Figs. 9-15.

GTAGGAGGCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGGAAATGT encoded by the human genome.

GTATTGTTGG GAM336797 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAGGTCCTGA GAM336797 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GGGAGGAAGT GAM336797 precursor RNA does not encode a protein. A nucleotide sequence identical or

TTGGGATGAA highly similar to the nucleotide sequence of GAM336797 precursor RNA is designated SEQ

ID:7297, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7297 is located from position 46014999 to position 46015128 relative to chromosome 19 on the `+` strand.

GAM336797 precursor RNA folds onto itself, forming GAM336797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336797 precursor RNA, designated SEQ ID NO: 7297, and a schematic representation of a predicted secondary folding of GAM336797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336797 folded precursor RNA yielding a GAM336797 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336797 RNA, hereby incorporated herein.

GAM336797 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336797 target RNA, herein designated GAM TARGET RNA.

GAM336797 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336797 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336797 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336797 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336797 RNA, herein designated GAM RNA, to target binding sites on GAM336797 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336797 target RNA into GAM336797 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336797 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336797 target genes. The mRNA of each one of this plurality of GAM336797 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336797 RNA, herein designated GAM RNA, and which when bound by GAM336797 RNA causes inhibition of translation of the GAM336797 target mRNA into a corresponding GAM336797 target protein.

The mechanism of the translational inhibition exerted by GAM336797 RNA, herein designated GAM RNA, on one or more GAM336797 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336797 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336797 RNA, herein designated GAM RNA, of GAM336797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336797 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336797 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336797 RNA correlate with, and may be deduced from, the identity of the GAM336797 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336798 7147 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCTGGGAG Messenger 336798 (GAM336798) oligonucleotides modulates expression of respective target

GCAGAGGTTG genes whose function and utility is known in the art.

TGGTGAGCCG GAM336798 is a novel bioinformatically detectable regulatory, non protein

AGATGAGGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336798 was detected

ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGTGTGA encoded by the human genome.

AACTCCGTCT GAM336798 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM336798 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336798 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336798 precursor RNA is designated SEQ ID:7147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7147 is located from position 46038899 to position 46039000

relative to chromosome 17 on the `+` strand.

GAM336798 precursor RNA folds onto itself, forming GAM336798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336798 precursor RNA, designated SEQ ID NO: 7147, and a schematic representation of a predicted secondary folding of GAM336798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336798 folded precursor RNA yielding a GAM336798 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336798 RNA, hereby incorporated herein. Expression of GAM336798 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336798 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336798 target RNA, herein designated GAM TARGET RNA.

GAM336798 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336798 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336798 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336798 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336798 RNA, herein designated GAM RNA, to target binding sites on GAM336798 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336798 target RNA into GAM336798 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336798 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336798 target genes. The mRNA of each one of this plurality of GAM336798 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336798 RNA, herein designated GAM RNA, and which when bound by GAM336798 RNA causes inhibition of translation of the GAM336798 target mRNA into a corresponding GAM336798 target protein.

The mechanism of the translational inhibition exerted by GAM336798 RNA, herein designated GAM RNA, on one or more GAM336798 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336798 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336798 RNA, herein designated GAM RNA, of GAM336798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336798 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336798 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336798 RNA correlate with, and may be deduced from, the identity of the GAM336798 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336799 6400 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCTGGGAGG Messenger 336799 (GAM336799) oligonucleotides modulates expression of respective target

CAGAGGTTGT genes whose function and utility is known in the art.

GGTGAGCCGA GAM336799 is a novel bioinformatically detectable regulatory, non protein

GATGAGGTCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336799 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAGTGTGAA encoded by the human genome.

ACTCCGTCTC GAM336799 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336799 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336799 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336799 precursor RNA is designated SEQ ID:6400, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6400 is located from position 46038900 to position 46038999 relative to chromosome 17 on the `+` strand.

GAM336799 precursor RNA folds onto itself, forming GAM336799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336799 precursor RNA, designated SEQ ID NO: 6400, and a schematic representation of a predicted secondary folding of GAM336799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336799 folded precursor RNA yielding a GAM336799 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336799 RNA, hereby incorporated herein. Expression of GAM336799 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336799 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336799 target RNA, herein designated GAM TARGET RNA.

GAM336799 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336799 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336799 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336799 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336799 RNA, herein designated GAM RNA, to target binding sites on GAM336799 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336799 target RNA into GAM336799 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336799 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336799 target genes. The mRNA of each one of this plurality of GAM336799 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336799 RNA, herein designated GAM RNA, and which when bound by GAM336799 RNA causes inhibition of translation of the GAM336799 target mRNA into a corresponding GAM336799 target protein.

The mechanism of the translational inhibition exerted by GAM336799 RNA, herein designated GAM RNA, on one or more GAM336799 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336799 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336799 RNA, herein designated GAM RNA, of GAM336799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336799 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336799 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336799 RNA correlate with, and may be deduced from, the identity of the GAM336799 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336800 6002 CACTCCCTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGAAGGTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GTGTGTTAGG Messenger 336800 (GAM336800) oligonucleotides modulates expression of respective target

AAATGTGCTT genes whose function and utility is known in the art.

ACTGGGTGAA GAM336800 is a novel bioinformatically detectable regulatory, non protein
CACAACAGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336800 was detected
GTGTTCCCCA is described with additional reference to Figs. 9-15.

CCTCATGATA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCCACAGTCT encoded by the human genome.

AGGGAGTG GAM336800 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336800 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336800 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336800 precursor RNA is designated SEQ ID:6002, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6002 is located from position 46120406 to position 46120503 relative to chromosome 13 on the `+` strand.

GAM336800 precursor RNA folds onto itself, forming GAM336800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336800 precursor RNA, designated SEQ ID NO: 6002, and a schematic representation of a predicted secondary folding of GAM336800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336800 folded precursor RNA yielding a GAM336800 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336800 RNA, hereby incorporated herein.

GAM336800 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336800 target RNA, herein designated GAM TARGET RNA.

GAM336800 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336800 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336800 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336800 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336800 RNA, herein designated GAM RNA, to target binding sites on GAM336800 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336800 target RNA into GAM336800 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336800 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336800 target genes. The mRNA of each one of this plurality of GAM336800 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336800 RNA, herein designated GAM RNA, and which when bound by GAM336800 RNA causes inhibition of translation of the GAM336800 target mRNA into a corresponding GAM336800 target protein.

The mechanism of the translational inhibition exerted by GAM336800 RNA, herein designated GAM RNA, on one or more GAM336800 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336800 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336800 RNA, herein designated GAM RNA, of GAM336800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336800 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336800 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336800 RNA correlate with, and may be deduced from, the identity of the GAM336800 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336801 5866 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336801 (GAM336801) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336801 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336801 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336801 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336801 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336801 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336801 precursor RNA is designated SEQ ID:5866, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5866 is located from position 46150469 to position 46150550 relative to chromosome 19 on the `-` strand.

GAM336801 precursor RNA folds onto itself, forming GAM336801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336801 precursor RNA, designated SEQ ID NO: 5866, and a schematic representation of a predicted secondary folding of GAM336801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336801 folded precursor RNA yielding a GAM336801 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336801 RNA, hereby incorporated herein.

GAM336801 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336801 target RNA, herein designated GAM TARGET RNA.

GAM336801 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336801 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336801 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336801 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336801 RNA, herein designated GAM RNA, to target binding sites on GAM336801 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336801 target RNA into GAM336801 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336801 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336801 target genes. The mRNA of each one of this plurality of GAM336801 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336801 RNA, herein designated GAM RNA, and which when bound by GAM336801 RNA causes inhibition of translation of the GAM336801 target mRNA into a corresponding GAM336801 target protein.

The mechanism of the translational inhibition exerted by GAM336801 RNA, herein designated GAM RNA, on one or more GAM336801 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336801 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336801 RNA, herein designated GAM RNA, of GAM336801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336801 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336801 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336801 RNA correlate with, and may be deduced from, the identity of the GAM336801 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTCAGTTTTA genes whose function and utility is known in the art.

CTTATCTCTA GAM336804 is a novel bioinformatically detectable regulatory, non protein
AAAGGGGTAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336804 was detected
AGTAACAGCA is described with additional reference to Figs. 9-15.

CTCACTGGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGAGTGTGG encoded by the human genome.

TTATGCCTCC GAM336804 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CAGCC GAM336804 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336804 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336804 precursor RNA is designated SEQ ID:6766, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6766 is located from position 46229800 to position 46229904 relative to chromosome 11 on the `+` strand.

GAM336804 precursor RNA folds onto itself, forming GAM336804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336804 precursor RNA, designated SEQ ID NO: 6766, and a schematic representation of a predicted secondary folding of GAM336804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336804 folded precursor

RNA yielding a GAM336804 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336804 RNA, hereby incorporated herein.

GAM336804 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336804 target RNA, herein designated GAM TARGET RNA.

GAM336804 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336804 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336804 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336804 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336804 RNA, herein designated GAM RNA, to target binding sites on GAM336804 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336804 target RNA into GAM336804 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336804 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336804 target genes. The mRNA of each one of this plurality of GAM336804 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336804 RNA, herein designated GAM RNA, and which when bound by GAM336804 RNA causes inhibition of translation of the GAM336804 target mRNA into a corresponding GAM336804 target protein.

The mechanism of the translational inhibition exerted by GAM336804 RNA, herein designated GAM RNA, on one or more GAM336804 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336804 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336804 RNA, herein designated GAM RNA, of GAM336804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336804 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336804 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336804 RNA correlate with, and may be deduced from, the identity of the GAM336804 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336806 5867 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336806 (GAM336806) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336806 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336806 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336806 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336806 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336806 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336806 precursor RNA is designated SEQ ID:5867, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5867 is located from position 46270121 to position 46270202 relative to chromosome 16 on the `-` strand.

GAM336806 precursor RNA folds onto itself, forming GAM336806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336806 precursor RNA, designated SEQ ID NO: 5867, and a schematic representation of a predicted secondary folding of GAM336806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336806 folded precursor RNA yielding a GAM336806 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336806 RNA, hereby incorporated herein.

GAM336806 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336806 target RNA, herein designated GAM TARGET RNA.

GAM336806 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336806 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336806 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336806 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336806 RNA, herein designated GAM RNA, to target binding sites on GAM336806 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336806 target RNA into GAM336806 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336806 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336806 target genes. The mRNA of each one of this plurality of GAM336806 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336806 RNA, herein designated GAM RNA, and which when bound by GAM336806 RNA causes inhibition of translation of the GAM336806 target mRNA into a corresponding GAM336806 target protein.

The mechanism of the translational inhibition exerted by GAM336806 RNA, herein designated GAM RNA, on one or more GAM336806 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336806 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336806 RNA, herein designated GAM RNA, of GAM336806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336806 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336806 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336806 RNA correlate with, and may be deduced from, the identity of the GAM336806 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336807 6217 CTGCCTAGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TAGTGAGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ATCCATTCTG Messenger 336807 (GAM336807) oligonucleotides modulates expression of respective target

GCTTCAGACC genes whose function and utility is known in the art.

AGTCTGGGTT GAM336807 is a novel bioinformatically detectable regulatory, non protein

TGAAACCTAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336807 was detected

ACATCCCACT is described with additional reference to Figs. 9-15.

AACTTAGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

G encoded by the human genome.

GAM336807 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336807 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336807 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336807 precursor RNA is designated SEQ ID:6217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6217 is located from position 46314585 to position 46314665 relative to chromosome 17 on the `-` strand.

GAM336807 precursor RNA folds onto itself, forming GAM336807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336807 precursor RNA, designated SEQ ID NO: 6217, and a schematic representation of a predicted secondary folding of GAM336807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336807 folded precursor RNA yielding a GAM336807 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336807 RNA, hereby incorporated herein.

GAM336807 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336807 target RNA, herein designated GAM TARGET RNA.

GAM336807 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336807 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336807 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336807 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336807 RNA, herein designated GAM RNA, to target binding sites on GAM336807 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336807 target RNA into GAM336807 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336807 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336807 target genes. The mRNA of each one of this plurality of GAM336807 target genes comprises one or more target binding sites, each

having a nucleotide sequence which is at least partly complementary to GAM336807 RNA, herein designated GAM RNA, and which when bound by GAM336807 RNA causes inhibition of translation of the GAM336807 target mRNA into a corresponding GAM336807 target protein.

The mechanism of the translational inhibition exerted by GAM336807 RNA, herein designated GAM RNA, on one or more GAM336807 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336807 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336807 RNA, herein designated GAM RNA, of GAM336807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336807 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336807 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336807 RNA correlate with, and may be deduced from, the identity of the GAM336807 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336809 5669 AAGGATGTGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TCACTGAAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTACCATACA Messenger 336809 (GAM336809) oligonucleotides modulates expression of respective target

TATGTGACCC genes whose function and utility is known in the art.

TTATTAGTTA GAM336809 is a novel bioinformatically detectable regulatory, non protein

CACATAAGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336809 was detected

ATTTTTATGG is described with additional reference to Figs. 9-15.

TGGTCTTTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCCCTTATCT encoded by the human genome.

TT GAM336809 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336809 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336809 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336809 precursor RNA is designated SEQ ID:5669, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5669 is located from position 46540199 to position 46540291 relative to chromosome 14 on the `+` strand.

GAM336809 precursor RNA folds onto itself, forming GAM336809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336809 precursor RNA, designated SEQ ID NO: 5669, and a schematic representation of a predicted secondary folding of GAM336809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336809 folded precursor RNA yielding a GAM336809 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336809 RNA, hereby incorporated herein. Expression of GAM336809 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336809 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336809 target RNA, herein designated GAM TARGET RNA.

GAM336809 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336809 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336809 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336809 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336809 RNA, herein designated GAM RNA, to target binding sites on GAM336809 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336809 target RNA into GAM336809 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336809 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336809 target genes. The mRNA of each one of this plurality of GAM336809 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336809 RNA, herein designated GAM RNA, and which when bound by GAM336809 RNA causes inhibition of translation of the GAM336809 target mRNA into a corresponding GAM336809 target protein.

The mechanism of the translational inhibition exerted by GAM336809 RNA, herein designated GAM RNA, on one or more GAM336809 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336809 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336809 RNA, herein designated GAM RNA, of GAM336809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336809 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336809 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336809 RNA correlate with, and may be deduced from, the identity of the GAM336809 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTTCCTGAGG GAM336811 is a novel bioinformatically detectable regulatory, non protein

GTTGTCTTGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336811 was detected

TCCAGTTTCT is described with additional reference to Figs. 9-15.

CAGCCACTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CCATGTGATA encoded by the human genome.

CC GAM336811 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336811 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336811 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336811 precursor RNA is designated SEQ ID:6855, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6855 is located from position 46654582 to position 46654673 relative to chromosome 11 on the `-` strand.

GAM336811 precursor RNA folds onto itself, forming GAM336811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336811 precursor RNA, designated SEQ ID NO: 6855, and a schematic representation of a predicted secondary folding of GAM336811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336811 folded precursor RNA yielding a GAM336811 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336811 RNA, hereby incorporated herein.

GAM336811 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336811 target RNA, herein designated GAM TARGET RNA.

GAM336811 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336811 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336811 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336811 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336811 RNA, herein designated GAM RNA, to target binding sites on GAM336811 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336811 target RNA into GAM336811 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336811 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336811 target genes. The mRNA of each one of this plurality of GAM336811 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336811 RNA, herein designated GAM RNA, and which when bound by GAM336811 RNA causes inhibition of translation of the GAM336811 target mRNA into a corresponding GAM336811 target protein.

The mechanism of the translational inhibition exerted by GAM336811 RNA, herein designated GAM RNA, on one or more GAM336811 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336811 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336811 RNA, herein designated GAM RNA, of GAM336811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336811 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336811 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336811 RNA correlate with, and may be deduced from, the identity of the GAM336811 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTGTAGTGGA GAM336812 is a novel bioinformatically detectable regulatory, non protein
GCATCCCAAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336812 was detected
CTGAAACTTT is described with additional reference to Figs. 9-15.

GTCTCAGTGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGAGACCCAG encoded by the human genome.

AAAGATGGGG GAM336812 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
T GAM336812 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336812 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336812 precursor RNA is designated SEQ ID:6516, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6516 is located from position 46926845 to position 46926945 relative to chromosome 21 on the `+` strand.

GAM336812 precursor RNA folds onto itself, forming GAM336812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336812 precursor RNA, designated SEQ ID NO: 6516, and a schematic representation of a predicted secondary folding of GAM336812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336812 folded precursor RNA yielding a GAM336812 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336812 RNA, hereby incorporated herein.

GAM336812 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336812 target RNA, herein designated GAM TARGET RNA.

GAM336812 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336812 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336812 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336812 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336812 RNA, herein designated GAM RNA, to target binding sites on GAM336812 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336812 target RNA into GAM336812 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336812 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336812 target genes. The mRNA of each one of this plurality of GAM336812 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336812 RNA, herein designated GAM RNA, and which when bound by GAM336812 RNA causes inhibition of translation of the GAM336812 target mRNA into a corresponding GAM336812 target protein.

The mechanism of the translational inhibition exerted by GAM336812 RNA, herein designated GAM RNA, on one or more GAM336812 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336812 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336812 RNA, herein designated GAM RNA, of GAM336812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336812 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336812 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336812 RNA correlate with, and may be deduced from, the identity of the GAM336812 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336814 (GAM336814) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336814 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336814 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336814 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336814 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336814 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336814 precursor RNA is designated SEQ ID:6491, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6491 is located from position 47053946 to position 47054014 relative to chromosome 20 on the `+` strand.

GAM336814 precursor RNA folds onto itself, forming GAM336814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336814 precursor RNA, designated SEQ ID NO: 6491, and a schematic representation of a predicted secondary folding of GAM336814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336814 folded precursor RNA yielding a GAM336814 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336814 RNA, hereby incorporated herein.

GAM336814 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336814 target RNA, herein designated GAM TARGET RNA.

GAM336814 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336814 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336814 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336814 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336814 RNA, herein designated GAM RNA, to target binding sites on GAM336814 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336814 target RNA into GAM336814 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336814 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336814 target genes. The mRNA of each one of this plurality of GAM336814 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336814 RNA, herein designated GAM RNA, and which when bound by GAM336814 RNA causes inhibition of translation of the GAM336814 target mRNA into a corresponding GAM336814 target protein.

The mechanism of the translational inhibition exerted by GAM336814 RNA, herein designated GAM RNA, on one or more GAM336814 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336814 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336814 RNA, herein designated GAM RNA, of GAM336814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336814 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336814 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336814 RNA correlate with, and may be deduced from, the identity of the GAM336814 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGTGAG encoded by the human genome.

ACCCTCTCTC GAM336815 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
A GAM336815 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336815 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336815 precursor RNA is designated SEQ ID:7118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7118 is located from position 47056630 to position 47056730 relative to chromosome 10 on the `-` strand.

GAM336815 precursor RNA folds onto itself, forming GAM336815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336815 precursor RNA, designated SEQ ID NO: 7118, and a schematic representation of a predicted secondary folding of GAM336815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336815 folded precursor RNA yielding a GAM336815 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336815 RNA, hereby incorporated herein. Expression of GAM336815 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336815 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336815 target RNA, herein designated GAM TARGET RNA.

GAM336815 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336815 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336815 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336815 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336815 RNA, herein designated GAM RNA, to target binding sites on GAM336815 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336815 target RNA into GAM336815 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336815 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336815 target genes. The mRNA of each one of this plurality of GAM336815 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336815 RNA, herein designated GAM RNA, and which when bound by GAM336815 RNA causes inhibition of translation of the GAM336815 target mRNA into a corresponding GAM336815 target protein.

The mechanism of the translational inhibition exerted by GAM336815 RNA, herein designated GAM RNA, on one or more GAM336815 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336815 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336815 RNA, herein designated GAM RNA, of GAM336815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336815 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336815 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336815 RNA correlate with, and may be deduced from, the identity of the GAM336815 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TATCAGACTT genes whose function and utility is known in the art.

TGTAGTGGCT GAM336817 is a novel bioinformatically detectable regulatory, non protein

GTGCATGTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336817 was detected

ATATCCTGGC is described with additional reference to Figs. 9-15.

CAGTAGGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGCGTGC encoded by the human genome.

GAM336817 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336817 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336817 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336817 precursor RNA is designated SEQ ID:6483, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6483 is located from position 47073424 to position 47073510 relative to chromosome 16 on the `+` strand.

GAM336817 precursor RNA folds onto itself, forming GAM336817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336817 precursor RNA, designated SEQ ID NO: 6483, and a schematic representation of a predicted secondary folding of GAM336817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336817 folded precursor RNA yielding a GAM336817 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336817 RNA, hereby incorporated herein.

GAM336817 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336817 target RNA, herein designated GAM TARGET RNA.

GAM336817 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336817 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336817 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336817 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336817 RNA, herein designated GAM RNA, to target binding sites on GAM336817 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336817 target RNA into GAM336817 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336817 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336817 target genes. The mRNA of each one of this plurality of GAM336817 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336817 RNA, herein designated GAM RNA, and which when bound by GAM336817 RNA causes inhibition of translation of the GAM336817 target mRNA into a corresponding GAM336817 target protein.

The mechanism of the translational inhibition exerted by GAM336817 RNA, herein designated GAM RNA, on one or more GAM336817 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336817 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336817 RNA, herein designated GAM RNA, of GAM336817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336817 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336817 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336817 RNA correlate with, and may be deduced from, the identity of the GAM336817 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336818 6090 CCCTGGCTGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTGGGATCC detected oligonucleotides of the present invention, referred to here as Genomic Address

CGAGGCCTCT Messenger 336818 (GAM336818) oligonucleotides modulates expression of respective target

CCAGTCCCCT genes whose function and utility is known in the art.

GAGGGTGCAC GAM336818 is a novel bioinformatically detectable regulatory, non protein
CACTGGCCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336818 was
detected
TCTCACCCAG is described with additional reference to Figs. 9-15.

GG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen
gene
encoded by the human genome.

GAM336818 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336818 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA
genes
GAM336818 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336818 precursor RNA is designated SEQ ID:6090, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6090 is located from position 47279033 to position 47279105 relative to chromosome 16 on the `+` strand.

GAM336818 precursor RNA folds onto itself, forming GAM336818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336818 precursor RNA, designated SEQ ID NO: 6090, and a schematic representation of a predicted secondary folding of GAM336818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336818 folded precursor RNA yielding a GAM336818 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336818 RNA, hereby incorporated herein. Expression of GAM336818 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336818 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336818 target RNA, herein designated GAM TARGET RNA.

GAM336818 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336818 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336818 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336818 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336818 RNA, herein designated GAM RNA, to target binding sites on GAM336818 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336818 target RNA into GAM336818 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336818 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336818 target genes. The mRNA of each one of this plurality of GAM336818 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336818 RNA, herein designated GAM RNA, and which when bound by GAM336818 RNA causes inhibition of translation of the GAM336818 target mRNA into a corresponding GAM336818 target protein.

The mechanism of the translational inhibition exerted by GAM336818 RNA, herein designated GAM RNA, on one or more GAM336818 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336818 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336818 RNA, herein designated GAM RNA, of GAM336818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336818 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336818 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336818 RNA correlate with, and may be deduced from, the identity of the GAM336818 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336819 5645 AAAAGCCATG Fig. 8 further provides a conceptual description of another novel bioinformatically
TTACAGATGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CTCTCCTTGG Messenger 336819 (GAM336819) oligonucleotides modulates expression of respective target
ATGGCTATTC genes whose function and utility is known in the art.

CAGTCGGTTT GAM336819 is a novel bioinformatically detectable regulatory, non protein
CCGGGGCTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336819 was detected
CTGGCCCACT is described with additional reference to Figs. 9-15.

CCATTTAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGTGTAGCTG encoded by the human genome.

TGAGTGTATT GAM336819 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TT GAM336819 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336819 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336819 precursor RNA is designated SEQ ID:5645, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5645 is located from position 47313354 to position 47313455 relative to chromosome 17 on the `+` strand.

GAM336819 precursor RNA folds onto itself, forming GAM336819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336819 precursor RNA, designated SEQ ID NO: 5645, and a schematic representation of a predicted secondary folding of GAM336819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336819 folded precursor RNA yielding a GAM336819 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336819 RNA, hereby incorporated herein.

GAM336819 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336819 target RNA, herein designated GAM TARGET RNA.

GAM336819 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336819 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336819 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336819 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336819 RNA, herein designated GAM RNA, to target binding sites on GAM336819 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336819 target RNA into GAM336819 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336819 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336819 target genes. The mRNA of each one of this plurality of GAM336819 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336819 RNA, herein designated GAM RNA, and which when bound by GAM336819 RNA causes inhibition of translation of the GAM336819 target mRNA into a corresponding GAM336819 target protein.

The mechanism of the translational inhibition exerted by GAM336819 RNA, herein designated GAM RNA, on one or more GAM336819 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336819 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336819 RNA, herein designated GAM RNA, of GAM336819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336819 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336819 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336819 RNA correlate with, and may be deduced from, the identity of the GAM336819 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336820 7109 TGAGGCAAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TCATTGCAAC GAM336820 is a novel bioinformatically detectable regulatory, non protein
ACTCCCTTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336820 was detected
GAGCTCTGAG is described with additional reference to Figs. 9-15.

TTTAAGCTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAAGTCTGAC encoded by the human genome.

TACCTTGCTG GAM336820 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CCA GAM336820 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336820 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336820 precursor RNA is designated SEQ ID:7109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7109 is located from position 47490707 to position 47490809 relative to chromosome 15 on the `+` strand.

GAM336820 precursor RNA folds onto itself, forming GAM336820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336820 precursor RNA, designated SEQ ID NO: 7109, and a schematic representation of a predicted secondary folding of GAM336820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336820 folded precursor

RNA yielding a GAM336820 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336820 RNA, hereby incorporated herein.

GAM336820 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336820 target RNA, herein designated GAM TARGET RNA.

GAM336820 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336820 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336820 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336820 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336820 RNA, herein designated GAM RNA, to target binding sites on GAM336820 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336820 target RNA into GAM336820 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336820 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336820 target genes. The mRNA of each one of this plurality of GAM336820 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336820 RNA, herein designated GAM RNA, and which when bound by GAM336820 RNA causes inhibition of translation of the GAM336820 target mRNA into a corresponding GAM336820 target protein.

The mechanism of the translational inhibition exerted by GAM336820 RNA, herein designated GAM RNA, on one or more GAM336820 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336820 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336820 RNA, herein designated GAM RNA, of GAM336820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336820 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336820 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336820 RNA correlate with, and may be deduced from, the identity of the GAM336820 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336821 folded precursor RNA yielding a GAM336821 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336821 RNA, hereby incorporated herein. Expression of GAM336821 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336821 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336821 target RNA, herein designated GAM TARGET RNA.

GAM336821 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336821 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336821 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336821 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336821 RNA, herein designated GAM RNA, to target binding sites on GAM336821 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336821 target RNA into GAM336821 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336821 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336821 target genes. The mRNA of each one of this plurality of GAM336821 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336821 RNA, herein designated GAM RNA, and which when bound by GAM336821 RNA causes inhibition of translation of the GAM336821 target mRNA into a corresponding GAM336821 target protein.

The mechanism of the translational inhibition exerted by GAM336821 RNA, herein designated GAM RNA, on one or more GAM336821 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336821 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336821 RNA, herein designated GAM RNA, of GAM336821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336821 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336821 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336821 RNA correlate with, and may be deduced from, the identity of the GAM336821 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336822 6100 CCGTCACAGC Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTTGCCCTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AATGTTCATC Messenger 336822 (GAM336822) oligonucleotides modulates expression of respective target

ACTGAAGACA genes whose function and utility is known in the art.

AGCATGTGAT GAM336822 is a novel bioinformatically detectable regulatory, non protein

TTTCTCATCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336822 was detected

CATCCTCCCA is described with additional reference to Figs. 9-15.

CTTCAAGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGCAGGGCAG encoded by the human genome.

TGAGG GAM336822 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336822 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336822 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336822 precursor RNA is designated SEQ

ID:6100, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6100 is located from position 47560720 to position 47560814 relative to chromosome 10 on the `+` strand.

GAM336822 precursor RNA folds onto itself, forming GAM336822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336822 precursor RNA, designated SEQ ID NO: 6100, and a schematic representation of a predicted secondary folding of GAM336822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336822 folded precursor RNA yielding a GAM336822 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336822 RNA, hereby incorporated herein.

GAM336822 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336822 target RNA, herein designated GAM TARGET RNA.

GAM336822 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336822 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336822 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336822 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336822 RNA, herein designated GAM RNA, to target binding sites on GAM336822 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336822 target RNA into GAM336822 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336822 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336822 target genes. The mRNA of each one of this plurality of GAM336822 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336822 RNA, herein designated GAM RNA, and which when bound by GAM336822 RNA causes inhibition of translation of the GAM336822 target mRNA into a corresponding GAM336822 target protein.

The mechanism of the translational inhibition exerted by GAM336822 RNA, herein designated GAM RNA, on one or more GAM336822 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336822 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336822 RNA, herein designated GAM RNA, of GAM336822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336822 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336822 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336822 RNA correlate with, and may be deduced from, the identity of the GAM336822 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336823 5791 AGGGTGTGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGGGCAAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCAGGGCGGC Messenger 336823 (GAM336823) oligonucleotides modulates expression of respective target

AGGTGTCAGG genes whose function and utility is known in the art.

CCGGCTTGGA GAM336823 is a novel bioinformatically detectable regulatory, non protein

CAATGAAACC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336823 was detected

CTGACCTTGC is described with additional reference to Figs. 9-15.

TGCATTCCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336823 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336823 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336823 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336823 precursor RNA is designated SEQ ID:5791, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5791 is located from position 47606004 to position 47606083 relative to chromosome X on the `-` strand.

GAM336823 precursor RNA folds onto itself, forming GAM336823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336823 precursor RNA, designated SEQ ID NO: 5791, and a schematic representation of a predicted secondary folding of GAM336823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336823 folded precursor RNA yielding a GAM336823 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336823 RNA, hereby incorporated herein.

GAM336823 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336823 target RNA, herein designated GAM TARGET RNA.

GAM336823 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336823 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336823 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336823 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336823 RNA, herein designated GAM RNA, to target binding sites on GAM336823 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336823 target RNA into GAM336823 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336823 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336823 target genes. The mRNA of each one of this plurality of GAM336823 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336823 RNA, herein designated GAM RNA, and which when bound by GAM336823 RNA causes inhibition of translation of the GAM336823 target mRNA into a corresponding GAM336823 target protein.

The mechanism of the translational inhibition exerted by GAM336823 RNA, herein designated GAM RNA, on one or more GAM336823 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336823 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336823 RNA, herein designated GAM RNA, of GAM336823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336823 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336823 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336823 RNA correlate with, and may be deduced from, the identity of the GAM336823 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336824 6647 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCAGAGG Messenger 336824 (GAM336824) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM336824 is a novel bioinformatically detectable regulatory, non protein
ACTACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336824 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGACTCC encoded by the human genome.

GAM336824 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336824 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336824 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336824 precursor RNA is designated SEQ ID:6647, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6647 is located from position 47747389 to position 47747476 relative to chromosome 19 on the `-` strand.

GAM336824 precursor RNA folds onto itself, forming GAM336824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336824 precursor RNA, designated SEQ ID NO: 6647, and a schematic representation of a predicted secondary folding of GAM336824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336824 folded precursor RNA yielding a GAM336824 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336824 RNA, hereby incorporated herein. Expression of GAM336824 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336824 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336824 target RNA, herein designated GAM TARGET RNA.

GAM336824 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336824 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336824 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336824 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336824 RNA, herein designated GAM RNA, to target binding sites on GAM336824 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336824 target RNA into GAM336824 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336824 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336824 target genes. The mRNA of each one of this plurality of GAM336824 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336824 RNA, herein designated GAM RNA, and which when bound by GAM336824 RNA causes inhibition of translation of the GAM336824 target mRNA into a corresponding GAM336824 target protein.

The mechanism of the translational inhibition exerted by GAM336824 RNA, herein designated GAM RNA, on one or more GAM336824 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336824 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336824 RNA, herein designated GAM RNA, of GAM336824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336824 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336824 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336824 RNA correlate with, and may be deduced from, the identity of the GAM336824 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336825 6323 GAGAATCGCT Fig. 8 further provides a conceptual description of another novel bioinformatically
TGAACCCAGG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGACTGAGGT Messenger 336825 (GAM336825) oligonucleotides modulates expression of respective target
TGCAGTGAGC genes whose function and utility is known in the art.

TGAGATCATG GAM336825 is a novel bioinformatically detectable regulatory, non protein
CAACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336825 was detected
CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACACAGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGACTTCATC encoded by the human genome.

TC GAM336825 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336825 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336825 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336825 precursor RNA is designated SEQ ID:6323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6323 is located from position 47783494 to position 47783585 relative to chromosome X on the `-` strand.

GAM336825 precursor RNA folds onto itself, forming GAM336825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336825 precursor RNA, designated SEQ ID NO: 6323, and a schematic representation of a predicted secondary folding of GAM336825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336825 folded precursor RNA yielding a GAM336825 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336825 RNA, hereby incorporated herein. Expression of GAM336825 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336825 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336825 target RNA, herein designated GAM TARGET RNA.

GAM336825 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336825 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336825 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336825 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336825 RNA, herein designated GAM RNA, to target binding sites on GAM336825 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336825 target RNA into GAM336825 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336825 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336825 target genes. The mRNA of each one of this plurality of GAM336825 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336825 RNA, herein designated GAM RNA, and which when bound by GAM336825 RNA causes inhibition of translation of the GAM336825 target mRNA into a corresponding GAM336825 target protein.

The mechanism of the translational inhibition exerted by GAM336825 RNA, herein designated GAM RNA, on one or more GAM336825 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336825 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336825 RNA, herein designated GAM RNA, of GAM336825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336825 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336825 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336825 RNA correlate with, and may be deduced from, the identity of the GAM336825 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CCAGACTGTG genes whose function and utility is known in the art.

AGGGGTGTAA GAM336827 is a novel bioinformatically detectable regulatory, non protein
GGAAGATGGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336827 was detected
AGATGTTGCG is described with additional reference to Figs. 9-15.

GGAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336827 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336827 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336827 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336827 precursor RNA is designated SEQ ID:7304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7304 is located from position 47935242 to position 47935317 relative to chromosome 17 on the `+` strand.

GAM336827 precursor RNA folds onto itself, forming GAM336827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336827 precursor RNA, designated SEQ ID NO: 7304, and a schematic representation of a predicted secondary folding of GAM336827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336827 folded precursor RNA yielding a GAM336827 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336827 RNA, hereby incorporated herein.

GAM336827 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336827 target RNA, herein designated GAM TARGET RNA.

GAM336827 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336827 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336827 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336827 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336827 RNA, herein designated GAM RNA, to target binding sites on GAM336827 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336827 target RNA into GAM336827 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336827 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336827 target genes. The mRNA of each one of this plurality of GAM336827 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336827 RNA, herein designated GAM RNA, and which when bound by GAM336827 RNA causes inhibition of translation of the GAM336827 target mRNA into a corresponding GAM336827 target protein.

The mechanism of the translational inhibition exerted by GAM336827 RNA, herein

designated GAM RNA, on one or more GAM336827 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336827 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336827 RNA, herein designated GAM RNA, of GAM336827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336827 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336827 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336827 RNA correlate with, and may be deduced from, the identity of the GAM336827 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336828 7069 TCTCTGTCTT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCATTCCCCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTACGCCCC Messenger 336828 (GAM336828) oligonucleotides modulates expression of respective target

CAGACTGTGA genes whose function and utility is known in the art.

GGGGTGTAAG GAM336828 is a novel bioinformatically detectable regulatory, non protein

GAAGATGGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336828 was detected

GATGTTGCGG is described with additional reference to Figs. 9-15.

GAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336828 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336828 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336828 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336828 precursor RNA is designated SEQ ID:7069, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7069 is located from position 47935243 to position 47935316

relative to chromosome 17 on the `+` strand.

GAM336828 precursor RNA folds onto itself, forming GAM336828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336828 precursor RNA, designated SEQ ID NO: 7069, and a schematic representation of a predicted secondary folding of GAM336828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336828 folded precursor RNA yielding a GAM336828 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336828 RNA, hereby incorporated herein.

GAM336828 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336828 target RNA, herein designated GAM TARGET RNA.

GAM336828 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336828 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336828 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336828 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336828 RNA, herein designated GAM RNA, to target binding sites on GAM336828 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336828 target RNA into GAM336828 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336828 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336828 target genes. The mRNA of each one of this plurality of GAM336828 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336828 RNA, herein designated GAM RNA, and which when bound by GAM336828 RNA causes inhibition of translation of the GAM336828 target mRNA into a corresponding GAM336828 target protein.

The mechanism of the translational inhibition exerted by GAM336828 RNA, herein designated GAM RNA, on one or more GAM336828 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336828 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336828 RNA, herein designated GAM RNA, of GAM336828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336828 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336828 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336828 RNA correlate with, and may be deduced from, the identity of the GAM336828 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336829 7063 TCTCAACTTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTATGTCTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTACAGTGG Messenger 336829 (GAM336829) oligonucleotides modulates expression of respective target

GTGTAGGGAC genes whose function and utility is known in the art.

CAGCCACACA GAM336829 is a novel bioinformatically detectable regulatory, non protein

GGGTCGGTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336829 was detected

GTTTTTCTCC is described with additional reference to Figs. 9-15.

CCGTGTGCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGATGAGAGA encoded by the human genome.

TTGTAGA GAM336829 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336829 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336829 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336829 precursor RNA is designated SEQ ID:7063, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7063 is located from position 47956679 to position 47956775 relative to chromosome 19 on the `+` strand.

GAM336829 precursor RNA folds onto itself, forming GAM336829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336829 precursor RNA, designated SEQ ID NO: 7063, and a schematic representation of a predicted secondary folding of GAM336829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336829 folded precursor RNA yielding a GAM336829 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336829 RNA, hereby incorporated herein.

GAM336829 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336829 target RNA, herein designated GAM TARGET RNA.

GAM336829 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336829 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336829 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336829 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336829 RNA, herein designated GAM RNA, to target binding sites on GAM336829 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336829 target RNA into GAM336829 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336829 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336829 target genes. The mRNA of each one of this plurality of GAM336829 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336829 RNA, herein designated GAM RNA, and which when bound by GAM336829 RNA causes inhibition of translation of the GAM336829 target mRNA into a corresponding GAM336829 target protein.

The mechanism of the translational inhibition exerted by GAM336829 RNA, herein designated GAM RNA, on one or more GAM336829 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336829 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336829 RNA, herein designated GAM RNA, of GAM336829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336829 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336829 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336829 RNA correlate with, and may be deduced from, the identity of the GAM336829 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336830 6085 CCCTCAGCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAAAGGATC GAM336830 is a novel bioinformatically detectable regulatory, non protein

TTTCTTAATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336830 was detected

CCAGGACTCC is described with additional reference to Figs. 9-15.

TGAGTTGGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

G encoded by the human genome.

GAM336830 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336830 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336830 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336830 precursor RNA is designated SEQ ID:6085, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6085 is located from position 47994779 to position 47994859 relative to chromosome 17 on the `+` strand.

GAM336830 precursor RNA folds onto itself, forming GAM336830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336830 precursor RNA, designated SEQ ID NO: 6085, and a schematic representation of a predicted secondary folding of GAM336830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336830 folded precursor RNA yielding a GAM336830 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336830 RNA, hereby incorporated herein.

GAM336830 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336830 target RNA, herein designated GAM TARGET RNA.

GAM336830 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336830 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336830 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336830 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows

three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336830 RNA, herein designated GAM RNA, to target binding sites on GAM336830 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336830 target RNA into GAM336830 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336830 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336830 target genes. The mRNA of each one of this plurality of GAM336830 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336830 RNA, herein designated GAM RNA, and which when bound by GAM336830 RNA causes inhibition of translation of the GAM336830 target mRNA into a corresponding GAM336830 target protein.

The mechanism of the translational inhibition exerted by GAM336830 RNA, herein designated GAM RNA, on one or more GAM336830 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336830 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

CTCAGTGGTT encoded by the human genome.

CAGACACTGT GAM336833 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TTTTCAAAGC GAM336833 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
CAGCAGAAGT GAM336833 precursor RNA does not encode a protein. A nucleotide sequence identical or

CTTGCCAAAT highly similar to the nucleotide sequence of GAM336833 precursor RNA is designated SEQ

T ID:6355, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6355 is located from position 48164886 to position 48165016 relative to chromosome 16 on the `-` strand.

GAM336833 precursor RNA folds onto itself, forming GAM336833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336833 precursor RNA, designated SEQ ID NO: 6355, and a schematic representation of a predicted secondary folding of GAM336833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336833 folded precursor RNA yielding a GAM336833 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336833 RNA, hereby incorporated herein.

GAM336833 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336833 target RNA, herein designated GAM TARGET RNA.

GAM336833 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336833 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336833 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336833 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336833 RNA, herein designated GAM RNA, to target binding sites on GAM336833 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336833 target RNA into GAM336833 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336833 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336833 target genes. The mRNA of each one of this plurality of GAM336833 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336833 RNA, herein designated GAM RNA, and which when bound by GAM336833 RNA causes inhibition of translation of the GAM336833 target mRNA into a corresponding GAM336833 target protein.

The mechanism of the translational inhibition exerted by GAM336833 RNA, herein designated GAM RNA, on one or more GAM336833 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336833 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336833 RNA, herein designated GAM RNA, of GAM336833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336833 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336833 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336833 RNA correlate with, and may be deduced from, the identity of the GAM336833 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336834 6569 GCTTTGATGA Fig. 8 further provides a conceptual description of another novel bioinformatically
CCAGGTTTCA detected oligonucleotides of the present invention, referred to here as Genomic Address
TTAGGTAAGA Messenger 336834 (GAM336834) oligonucleotides modulates expression of respective target
AGGCCCGATT genes whose function and utility is known in the art.

AAGCAACGGT GAM336834 is a novel bioinformatically detectable regulatory, non protein
GGCCCAAATA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336834 was detected
ACCTCAGTGG is described with additional reference to Figs. 9-15.

TTCAGACACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTTTTTCAAA encoded by the human genome.

GC GAM336834 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336834 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336834 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336834 precursor RNA is designated SEQ ID:6569, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6569 is located from position 48164907 to position 48164998 relative to chromosome 16 on the `-` strand.

GAM336834 precursor RNA folds onto itself, forming GAM336834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336834 precursor RNA, designated SEQ ID NO: 6569, and a schematic representation of a predicted secondary folding of GAM336834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336834 folded precursor RNA yielding a GAM336834 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336834 RNA, hereby incorporated herein.

GAM336834 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336834 target RNA, herein designated GAM TARGET RNA.

GAM336834 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336834 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336834 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336834 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336834 RNA, herein designated GAM RNA, to target binding sites on GAM336834 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336834 target RNA into GAM336834 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336834 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336834 target genes. The mRNA of each one of this plurality of GAM336834 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336834 RNA, herein designated GAM RNA, and which when bound by GAM336834 RNA causes inhibition of translation of the GAM336834 target mRNA into a corresponding GAM336834 target protein.

The mechanism of the translational inhibition exerted by GAM336834 RNA, herein designated GAM RNA, on one or more GAM336834 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336834 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336834 RNA, herein designated GAM RNA, of GAM336834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336834 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336834 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336834 RNA correlate with, and may be deduced from, the identity of the GAM336834 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336835 7120 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGCCCAGGAG Messenger 336835 (GAM336835) oligonucleotides modulates expression of respective target

GTGGAGGCTG genes whose function and utility is known in the art.

CAGTGACCCA GAM336835 is a novel bioinformatically detectable regulatory, non protein

TATTCATGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336835 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGTGAG encoded by the human genome.

ACCCTCTCTC GAM336835 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336835 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336835 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336835 precursor RNA is designated SEQ ID:7120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7120 is located from position 48175291 to position 48175391 relative to chromosome 10 on the `+` strand.

GAM336835 precursor RNA folds onto itself, forming GAM336835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336835 precursor RNA, designated SEQ ID NO: 7120, and a schematic representation of a predicted secondary folding of GAM336835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336835 folded precursor RNA yielding a GAM336835 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336835 RNA, hereby incorporated herein. Expression of GAM336835 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336835 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336835 target RNA, herein designated GAM TARGET RNA.

GAM336835 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336835 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336835 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336835 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336835 RNA, herein designated GAM RNA, to target binding sites on GAM336835 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336835 target RNA into GAM336835 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336835 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336835 target genes. The mRNA of each one of this plurality of GAM336835 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336835 RNA,

herein designated GAM RNA, and which when bound by GAM336835 RNA causes inhibition of translation of the GAM336835 target mRNA into a corresponding GAM336835 target protein.

The mechanism of the translational inhibition exerted by GAM336835 RNA, herein designated GAM RNA, on one or more GAM336835 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336835 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336835 RNA, herein designated GAM RNA, of GAM336835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336835 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336835 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336835 RNA correlate with, and may be deduced from, the identity of the GAM336835 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336836 7083 TCTTTTTCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGTCTCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TTGTGGCAGT Messenger 336836 (GAM336836) oligonucleotides modulates expression of respective target

CATGAATGAG genes whose function and utility is known in the art.

ACTCTGTCAG GAM336836 is a novel bioinformatically detectable regulatory, non protein

ATCTCCATGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336836 was detected

CAGGGACCTG is described with additional reference to Figs. 9-15.

ATTGACAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336836 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336836 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336836 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336836 precursor RNA is designated SEQ ID:7083, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7083 is located from position 48190562 to position 48190640 relative to chromosome 19 on the `+` strand.

GAM336836 precursor RNA folds onto itself, forming GAM336836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336836 precursor RNA, designated SEQ ID NO: 7083, and a schematic representation of a predicted secondary folding of GAM336836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336836 folded precursor RNA yielding a GAM336836 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336836 RNA, hereby incorporated herein.

GAM336836 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336836 target RNA, herein designated GAM TARGET RNA.

GAM336836 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336836 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336836 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336836 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336836 RNA, herein designated GAM RNA, to target binding sites on GAM336836 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336836 target RNA

into GAM336836 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336836 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336836 target genes. The mRNA of each one of this plurality of GAM336836 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336836 RNA, herein designated GAM RNA, and which when bound by GAM336836 RNA causes inhibition of translation of the GAM336836 target mRNA into a corresponding GAM336836 target protein.

The mechanism of the translational inhibition exerted by GAM336836 RNA, herein designated GAM RNA, on one or more GAM336836 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336836 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336836 RNA, herein designated GAM RNA, of GAM336836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336836 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336836 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336836 RNA correlate with, and may be deduced from, the identity of the GAM336836 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAGGACTCCT Messenger 336837 (GAM336837) oligonucleotides modulates expression of respective target
CACTCAACCT genes whose function and utility is known in the art.

CGGCCATGGA GAM336837 is a novel bioinformatically detectable regulatory, non protein
CGCAGGTTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336837 was detected
GTGTGAGGGG is described with additional reference to Figs. 9-15.

GGTCCCAGCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTCGGTCTT encoded by the human genome.

CTATTTC GAM336837 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336837 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336837 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336837 precursor RNA is designated SEQ ID:6314, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6314 is located from position 48206347 to position 48206443 relative to chromosome 10 on the `+` strand.

GAM336837 precursor RNA folds onto itself, forming GAM336837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336837 precursor RNA, designated SEQ ID NO: 6314, and a schematic representation of a predicted secondary folding of GAM336837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336837 folded precursor RNA yielding a GAM336837 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336837 RNA, hereby incorporated herein.

GAM336837 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336837 target RNA, herein designated GAM TARGET RNA.

GAM336837 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336837 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336837 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336837 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336837 RNA, herein designated GAM RNA, to target binding sites on GAM336837 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336837 target RNA into GAM336837 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336837 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336837 target genes. The mRNA of each one of this plurality of GAM336837 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336837 RNA, herein designated GAM RNA, and which when bound by GAM336837 RNA causes inhibition of translation of the GAM336837 target mRNA into a corresponding GAM336837 target protein.

The mechanism of the translational inhibition exerted by GAM336837 RNA, herein designated GAM RNA, on one or more GAM336837 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336837 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336837 RNA, herein designated GAM RNA, of GAM336837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336837 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336837 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336837 RNA correlate with, and may be deduced from, the identity of the GAM336837 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336838 6497 GCAGGTATGA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGCCTTTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCTTATCCTG Messenger 336838 (GAM336838) oligonucleotides modulates expression of respective target

GTTCCTGCAG genes whose function and utility is known in the art.

AGCTGACTGC GAM336838 is a novel bioinformatically detectable regulatory, non protein
CATGCTTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336838 was detected
AGAGGGAAAA is described with additional reference to Figs. 9-15.

GACTTATTTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCTGT encoded by the human genome.

GAM336838 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336838 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336838 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336838 precursor RNA is designated SEQ ID:6497, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6497 is located from position 48246637 to position 48246721 relative to chromosome 19 on the `-` strand.

GAM336838 precursor RNA folds onto itself, forming GAM336838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336838 precursor RNA, designated SEQ ID NO: 6497, and a schematic representation of a predicted secondary folding of GAM336838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336838 folded precursor RNA yielding a GAM336838 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336838 RNA, hereby incorporated herein.

GAM336838 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336838 target RNA, herein designated GAM TARGET RNA.

GAM336838 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336838 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336838 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336838 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336838 RNA, herein designated GAM RNA, to target binding sites on GAM336838 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336838 target RNA into GAM336838 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336838 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336838 target genes. The mRNA of each one of this plurality of GAM336838 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336838 RNA, herein designated GAM RNA, and which when bound by GAM336838 RNA causes inhibition of translation of the GAM336838 target mRNA into a corresponding GAM336838 target protein.

The mechanism of the translational inhibition exerted by GAM336838 RNA, herein designated GAM RNA, on one or more GAM336838 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336838 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336838 RNA, herein designated GAM RNA, of GAM336838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336838 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336838 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336838 RNA correlate with, and may be deduced from, the identity of the GAM336838 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336840 6695 GGAGAATTGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCAGTGG Messenger 336840 (GAM336840) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCGAGATTGT GAM336840 is a novel bioinformatically detectable regulatory, non protein
GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336840 was detected
TCCACCCTCA is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAAACTCC encoded by the human genome.

GAM336840 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336840 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336840 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336840 precursor RNA is designated SEQ ID:6695, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6695 is located from position 48506039 to position 48506126 relative to chromosome 17 on the `+` strand.

GAM336840 precursor RNA folds onto itself, forming GAM336840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336840 precursor RNA, designated SEQ ID NO: 6695, and a schematic representation of a predicted secondary folding of GAM336840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336840 folded precursor RNA yielding a GAM336840 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336840 RNA, hereby incorporated herein.

GAM336840 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336840 target RNA, herein designated GAM TARGET RNA.

GAM336840 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336840 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336840 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336840 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336840 RNA, herein designated GAM RNA, to target binding sites on GAM336840 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336840 target RNA into GAM336840 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336840 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336840 target genes. The mRNA of each one of this plurality of GAM336840 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336840 RNA, herein designated GAM RNA, and which when bound by GAM336840 RNA causes inhibition of translation of the GAM336840 target mRNA into a corresponding GAM336840 target protein.

The mechanism of the translational inhibition exerted by GAM336840 RNA, herein designated GAM RNA, on one or more GAM336840 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336840 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336840 RNA, herein designated GAM RNA, of GAM336840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336840 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336840 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336840 RNA correlate with, and may be deduced from, the identity of the GAM336840 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336841 7141 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCCGGGA Messenger 336841 (GAM336841) oligonucleotides modulates expression of respective target
GGTGGAGGTT genes whose function and utility is known in the art.

GCAGTGAGCC GAM336841 is a novel bioinformatically detectable regulatory, non protein
GAGATCGCGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336841 was detected
CATTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAAGAGTG encoded by the human genome.

AAACACTGTC GAM336841 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TCA GAM336841 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336841 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336841 precursor RNA is designated SEQ ID:7141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7141 is located from position 48685091 to position 48685193 relative to chromosome 4 on the `+` strand.

GAM336841 precursor RNA folds onto itself, forming GAM336841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336841 precursor RNA, designated SEQ ID NO: 7141, and a schematic representation of a predicted secondary folding of GAM336841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336841 folded precursor RNA yielding a GAM336841 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336841 RNA, hereby incorporated herein. Expression of GAM336841 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336841 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336841 target RNA, herein designated GAM TARGET RNA.

GAM336841 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336841 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336841 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336841 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336841 RNA, herein designated GAM RNA, to target binding sites on GAM336841 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336841 target RNA into GAM336841 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336841 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336841 target genes. The mRNA of each one of this plurality of GAM336841 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336841 RNA, herein designated GAM RNA, and which when bound by GAM336841 RNA causes inhibition of translation of the GAM336841 target mRNA into a corresponding GAM336841 target protein.

The mechanism of the translational inhibition exerted by GAM336841 RNA, herein designated GAM RNA, on one or more GAM336841 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336841 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336841 RNA, herein designated GAM RNA, of GAM336841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336841 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336841 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336841 RNA correlate with, and may be deduced from, the identity of the GAM336841 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336842 6919 GTGGTGCATA Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTGTAATCT detected oligonucleotides of the present invention, referred to here as Genomic Address

CAGATACTTG Messenger 336842 (GAM336842) oligonucleotides modulates expression of respective target

GGAGGTTGAG genes whose function and utility is known in the art.

GTGGTAGGAT GAM336842 is a novel bioinformatically detectable regulatory, non protein

TGCTTGAGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336842 was detected

CAGGAGTTTG is described with additional reference to Figs. 9-15.

AGGCTGCAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AAGCTATGAT encoded by the human genome.

CAC GAM336842 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336842 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336842 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336842 precursor RNA is designated SEQ ID:6919, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6919 is located from position 48783661 to position 48783753 relative to chromosome 14 on the `+` strand.

GAM336842 precursor RNA folds onto itself, forming GAM336842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336842 precursor RNA, designated SEQ ID NO: 6919, and a schematic representation of a predicted secondary folding of GAM336842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336842 folded precursor RNA yielding a GAM336842 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336842 RNA, hereby incorporated herein.

GAM336842 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336842 target RNA, herein designated GAM TARGET RNA.

GAM336842 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336842 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336842 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336842 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336842 RNA, herein designated GAM RNA, to target binding sites on GAM336842 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336842 target RNA into GAM336842 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336842 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336842 target genes. The mRNA of each one of this plurality of GAM336842 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336842 RNA, herein designated GAM RNA, and which when bound by GAM336842 RNA causes inhibition of translation of the GAM336842 target mRNA into a corresponding GAM336842 target protein.

The mechanism of the translational inhibition exerted by GAM336842 RNA, herein designated GAM RNA, on one or more GAM336842 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336842 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336842 RNA, herein designated GAM RNA, of GAM336842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336842 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336842 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336842 RNA correlate with, and may be deduced from, the identity of the GAM336842 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336844 6025 CAGGCTGGTT Fig. 8 further provides a conceptual description of another novel bioinformatically

CGTCGTTTCT detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCTCTCCAT Messenger 336844 (GAM336844) oligonucleotides modulates expression of respective target

TCTTGTCTTT genes whose function and utility is known in the art.

TTAATTCTTT GAM336844 is a novel bioinformatically detectable regulatory, non protein

GTGTTATTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336844 was detected

AGATGGAGTT is described with additional reference to Figs. 9-15.

TGAGAGGGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TATGAACAAG encoded by the human genome.

CCTG GAM336844 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336844 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336844 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336844 precursor RNA is designated SEQ ID:6025, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6025 is located from position 48973458 to position 48973551 relative to chromosome 22 on the `+` strand.

GAM336844 precursor RNA folds onto itself, forming GAM336844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336844 precursor RNA, designated SEQ ID NO: 6025, and a schematic representation of a predicted secondary folding of GAM336844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336844 folded precursor RNA yielding a GAM336844 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336844 RNA, hereby incorporated herein.

GAM336844 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336844 target RNA, herein designated GAM TARGET RNA.

GAM336844 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336844 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336844 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336844 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336844 RNA, herein designated GAM RNA, to target binding sites on GAM336844 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336844 target RNA into GAM336844 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336844 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336844 target genes. The mRNA of each one of this

plurality of GAM336844 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336844 RNA, herein designated GAM RNA, and which when bound by GAM336844 RNA causes inhibition of translation of the GAM336844 target mRNA into a corresponding GAM336844 target protein.

The mechanism of the translational inhibition exerted by GAM336844 RNA, herein designated GAM RNA, on one or more GAM336844 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336844 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336844 RNA, herein designated GAM RNA, of GAM336844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336844 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336844 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336844 RNA correlate with, and may be deduced from, the identity of the GAM336844 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTCGTTTCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
CCTCTCCATT Messenger 336845 (GAM336845) oligonucleotides modulates expression of respective target
CTTGTCTTTT genes whose function and utility is known in the art.

TAATTCTTTG GAM336845 is a novel bioinformatically detectable regulatory, non protein
TGTTATTTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336845 was detected
GATGGAGTTT is described with additional reference to Figs. 9-15.

GAGAGGGAAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATGAACAAGC encoded by the human genome.

CT GAM336845 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336845 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336845 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336845 precursor RNA is designated SEQ ID:5783, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5783 is located from position 48973459 to position 48973550 relative to chromosome 22 on the `+` strand.

GAM336845 precursor RNA folds onto itself, forming GAM336845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336845 precursor RNA, designated SEQ ID NO: 5783, and a schematic representation of a predicted secondary folding of GAM336845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336845 folded precursor RNA yielding a GAM336845 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336845 RNA, hereby incorporated herein.

GAM336845 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336845 target RNA, herein designated GAM TARGET RNA.

GAM336845 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336845 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336845 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336845 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336845 RNA, herein designated GAM RNA, to target binding sites on GAM336845 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336845 target RNA into GAM336845 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336845 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336845 target genes. The mRNA of each one of this plurality of GAM336845 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336845 RNA, herein designated GAM RNA, and which when bound by GAM336845 RNA causes inhibition of translation of the GAM336845 target mRNA into a corresponding GAM336845 target protein.

The mechanism of the translational inhibition exerted by GAM336845 RNA, herein designated GAM RNA, on one or more GAM336845 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336845 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336845 RNA, herein designated GAM RNA, of GAM336845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336845 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336845 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336845 RNA correlate with, and may be deduced from, the identity of the GAM336845 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336846 6801 GGGCATTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically
CCTCTGGTAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GGATGGCCAT Messenger 336846 (GAM336846) oligonucleotides modulates expression of respective target
GGTGCCAGCC genes whose function and utility is known in the art.

CTCCTGGGCC GAM336846 is a novel bioinformatically detectable regulatory, non protein
TCATTGGGTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336846 was detected
TCACCTATAC is described with additional reference to Figs. 9-15.

AGAAAGGCCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATAGACCC encoded by the human genome.

GAM336846 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336846 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336846 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336846 precursor RNA is designated SEQ ID:6801, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6801 is located from position 49032571 to position 49032658 relative to chromosome 12 on the `-` strand.

GAM336846 precursor RNA folds onto itself, forming GAM336846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336846 precursor RNA, designated SEQ ID NO: 6801, and a schematic representation of a predicted secondary folding of GAM336846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336846 folded precursor RNA yielding a GAM336846 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336846 RNA, hereby incorporated herein.

GAM336846 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336846 target RNA, herein designated GAM TARGET RNA.

GAM336846 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336846 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336846 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336846 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336846 RNA, herein designated GAM RNA, to target binding sites on GAM336846 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336846 target RNA into GAM336846 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336846 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336846 target genes. The mRNA of each one of this plurality of GAM336846 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336846 RNA, herein designated GAM RNA, and which when bound by GAM336846 RNA causes inhibition of translation of the GAM336846 target mRNA into a corresponding GAM336846 target protein.

The mechanism of the translational inhibition exerted by GAM336846 RNA, herein designated GAM RNA, on one or more GAM336846 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336846 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336846 RNA, herein designated GAM RNA, of GAM336846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336846 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336846 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336846 RNA correlate with, and may be deduced from, the identity of the GAM336846 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336847 5868 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336847 (GAM336847) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336847 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336847 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336847 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336847 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336847 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336847 precursor RNA is designated SEQ ID:5868, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5868 is located from position 49043749 to position 49043830 relative to chromosome 6 on the `+` strand.

GAM336847 precursor RNA folds onto itself, forming GAM336847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336847 precursor RNA, designated SEQ ID NO: 5868, and a schematic representation of a predicted secondary folding of GAM336847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336847 folded precursor RNA yielding a GAM336847 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336847 RNA, hereby incorporated herein.

GAM336847 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336847 target RNA, herein designated GAM TARGET RNA.

GAM336847 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336847 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336847 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336847 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336847 RNA, herein designated GAM RNA, to target binding sites on GAM336847 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336847 target RNA into GAM336847 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336847 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336847 target genes. The mRNA of each one of this plurality of GAM336847 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336847 RNA, herein designated GAM RNA, and which when bound by GAM336847 RNA causes inhibition of translation of the GAM336847 target mRNA into a corresponding GAM336847 target protein.

The mechanism of the translational inhibition exerted by GAM336847 RNA, herein designated GAM RNA, on one or more GAM336847 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336847 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336847 RNA, herein designated GAM RNA, of GAM336847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336847 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336847 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336847 RNA correlate with, and may be deduced from, the identity of the GAM336847 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336848 6973 TAGGGGCAGT Fig. 8 further provides a conceptual description of another novel bioinformatically
GGCAGAGAAT detected oligonucleotides of the present invention, referred to here as Genomic Address
GAATGTATGT Messenger 336848 (GAM336848) oligonucleotides modulates expression of respective target
GTGGGTTTCT genes whose function and utility is known in the art.

CAGCCTTGAG GAM336848 is a novel bioinformatically detectable regulatory, non protein
GTATAAGGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336848 was detected
TAAAGGCTCT is described with additional reference to Figs. 9-15.

GGGGATTCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGCATACACC encoded by the human genome.

ACTTCCAGTT GAM336848 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CAAGCGCCTA GAM336848 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336848 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336848 precursor RNA is designated SEQ ID:6973, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6973 is located from position 49044659 to position 49044768 relative to chromosome 12 on the `-` strand.

GAM336848 precursor RNA folds onto itself, forming GAM336848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336848 precursor RNA, designated SEQ ID NO: 6973, and a schematic representation of a predicted secondary folding of GAM336848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336848 folded precursor RNA yielding a GAM336848 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336848 RNA, hereby incorporated herein.

GAM336848 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336848 target RNA, herein designated GAM TARGET RNA.

GAM336848 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336848 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336848 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336848 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336848 RNA, herein designated GAM RNA, to target binding sites on GAM336848 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336848 target RNA into GAM336848 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336848 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336848 target genes. The mRNA of each one of this plurality of GAM336848 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336848 RNA, herein designated GAM RNA, and which when bound by GAM336848 RNA causes inhibition of translation of the GAM336848 target mRNA into a corresponding GAM336848 target protein.

The mechanism of the translational inhibition exerted by GAM336848 RNA, herein designated GAM RNA, on one or more GAM336848 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336848 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336848 RNA, herein designated GAM RNA, of GAM336848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336848 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336848 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336848 RNA correlate with, and may be deduced from, the identity of the GAM336848 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGTATGTGTG Messenger 336849 (GAM336849) oligonucleotides modulates expression of respective target
GGTTTCTCAG genes whose function and utility is known in the art.

CCTTGAGGTA GAM336849 is a novel bioinformatically detectable regulatory, non protein
TAAGGTCTAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336849 was detected
AGGCTCTGGG is described with additional reference to Figs. 9-15.

GATTCACTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATACACCACT encoded by the human genome.

TCC GAM336849 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336849 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336849 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336849 precursor RNA is designated SEQ ID:6800, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6800 is located from position 49044673 to position 49044765 relative to chromosome 12 on the `-` strand.

GAM336849 precursor RNA folds onto itself, forming GAM336849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336849 precursor RNA, designated SEQ ID NO: 6800, and a schematic representation of a predicted secondary folding of GAM336849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336849 folded precursor RNA yielding a GAM336849 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336849 RNA, hereby incorporated herein.

GAM336849 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336849 target RNA, herein designated GAM TARGET RNA.

GAM336849 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336849 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336849 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336849 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336849 RNA, herein designated GAM RNA, to target binding sites on GAM336849 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336849 target RNA into GAM336849 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336849 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336849 target genes. The mRNA of each one of this plurality of GAM336849 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336849 RNA, herein designated GAM RNA, and which when bound by GAM336849 RNA causes inhibition of translation of the GAM336849 target mRNA into a corresponding GAM336849 target protein.

The mechanism of the translational inhibition exerted by GAM336849 RNA, herein designated GAM RNA, on one or more GAM336849 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336849 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336849 RNA, herein designated GAM RNA, of GAM336849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336849 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336849 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336849 RNA correlate with, and may be deduced from, the identity of the GAM336849 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336852 7121 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGCCCAGGAG Messenger 336852 (GAM336852) oligonucleotides modulates expression of respective target

GTGGAGGCTG genes whose function and utility is known in the art.

CAGTGACCCA GAM336852 is a novel bioinformatically detectable regulatory, non protein

TATTCATGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336852 was detected

ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAGAGTGAG encoded by the human genome.

ACCCTCTCTC GAM336852 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336852 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336852 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336852 precursor RNA is designated SEQ ID:7121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7121 is located from position 49108311 to position 49108411 relative to chromosome 10 on the `-` strand.

GAM336852 precursor RNA folds onto itself, forming GAM336852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336852 precursor RNA, designated SEQ ID NO: 7121, and a schematic representation of a predicted secondary folding of GAM336852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336852 folded precursor RNA yielding a GAM336852 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336852 RNA, hereby incorporated herein. Expression of GAM336852 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336852 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336852 target RNA, herein designated GAM TARGET RNA.

GAM336852 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336852 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336852 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336852 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336852 RNA, herein designated GAM RNA, to target binding sites on GAM336852 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336852 target RNA into GAM336852 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336852 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336852 target genes. The mRNA of each one of this plurality of GAM336852 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336852 RNA, herein designated GAM RNA, and which when bound by GAM336852 RNA causes inhibition of translation of the GAM336852 target mRNA into a corresponding GAM336852 target protein.

The mechanism of the translational inhibition exerted by GAM336852 RNA, herein

designated GAM RNA, on one or more GAM336852 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336852 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336852 RNA, herein designated GAM RNA, of GAM336852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336852 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336852 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336852 RNA correlate with, and may be deduced from, the identity of the GAM336852 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336853 5998 CACGAGCAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGTGTCACA detected oligonucleotides of the present invention, referred to here as Genomic Address

GATGGCCGGA Messenger 336853 (GAM336853) oligonucleotides modulates expression of respective target

AGAGACTCTT genes whose function and utility is known in the art.

TTGCCTGGTT GAM336853 is a novel bioinformatically detectable regulatory, non protein

ACAGGCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336853 was detected

TTTTCTGCCA is described with additional reference to Figs. 9-15.

TCCTGTTGAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTTCCCATC encoded by the human genome.

AACTCCTTTG GAM336853 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336853 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336853 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336853 precursor RNA is designated SEQ ID:5998, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:5998 is located from position 49118815 to position 49118914 relative to chromosome 20 on the `+` strand.

GAM336853 precursor RNA folds onto itself, forming GAM336853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336853 precursor RNA, designated SEQ ID NO: 5998, and a schematic representation of a predicted secondary folding of GAM336853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336853 folded precursor RNA yielding a GAM336853 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336853 RNA, hereby incorporated herein.

GAM336853 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336853 target RNA, herein designated GAM TARGET RNA.

GAM336853 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336853 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336853 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336853 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336853 RNA, herein designated GAM RNA, to target binding sites on GAM336853 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336853 target RNA into GAM336853 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336853 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336853 target genes. The mRNA of each one of this plurality of GAM336853 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336853 RNA, herein designated GAM RNA, and which when bound by GAM336853 RNA causes inhibition of translation of the GAM336853 target mRNA into a corresponding GAM336853 target protein.

The mechanism of the translational inhibition exerted by GAM336853 RNA, herein designated GAM RNA, on one or more GAM336853 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336853 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336853 RNA, herein designated GAM RNA, of GAM336853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336853 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336853 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336853 RNA correlate with, and may be deduced from, the identity of the GAM336853 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336854 6327 GAGAATTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TAAACCCGGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGTGGAGGT Messenger 336854 (GAM336854) oligonucleotides modulates expression of respective target

TGCAGTGAGC genes whose function and utility is known in the art.

CAAGATCACG GAM336854 is a novel bioinformatically detectable regulatory, non protein

CCACTGCACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336854 was detected

CCAGCCTGGG is described with additional reference to Figs. 9-15.

CAACAGAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGACTC encoded by the human genome.

GAM336854 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336854 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336854 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336854 precursor RNA is designated SEQ ID:6327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6327 is located from position 49184841 to position 49184926 relative to chromosome 19 on the `+` strand.

GAM336854 precursor RNA folds onto itself, forming GAM336854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336854 precursor RNA, designated SEQ ID NO: 6327, and a schematic representation of a predicted secondary folding of GAM336854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336854 folded precursor RNA yielding a GAM336854 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336854 RNA, hereby incorporated herein. Expression of GAM336854 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336854 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336854 target RNA, herein designated GAM TARGET RNA.

GAM336854 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336854 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336854 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336854 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336854 RNA, herein designated GAM RNA, to target binding sites on GAM336854 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336854 target RNA into GAM336854 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336854 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336854 target genes. The mRNA of each one of this plurality of GAM336854 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336854 RNA, herein designated GAM RNA, and which when bound by GAM336854 RNA causes inhibition of translation of the GAM336854 target mRNA into a corresponding GAM336854 target protein.

The mechanism of the translational inhibition exerted by GAM336854 RNA, herein designated GAM RNA, on one or more GAM336854 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336854 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336854 RNA, herein designated GAM RNA, of GAM336854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336854 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336854 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336854 RNA correlate with, and may be deduced from, the identity of the GAM336854 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336855 6485 GCACCAGAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTCCAGGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGCTGATTAA Messenger 336855 (GAM336855) oligonucleotides modulates expression of respective target

AGTGTTAGCT genes whose function and utility is known in the art.

GGCTGACACA GAM336855 is a novel bioinformatically detectable regulatory, non protein
TTATGGTGGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336855 was detected
GTGGTAGAAA is described with additional reference to Figs. 9-15.

GTGTCTCATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TTAATAAGTC encoded by the human genome.

ACAGTGCTGC GAM336855 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CTAATCTGTG GAM336855 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
TGC GAM336855 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336855 precursor RNA is designated SEQ ID:6485, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6485 is located from position 49197664 to position 49197776 relative to chromosome 14 on the `-` strand.

GAM336855 precursor RNA folds onto itself, forming GAM336855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336855 precursor RNA, designated SEQ ID NO: 6485, and a schematic representation of a predicted secondary folding of GAM336855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336855 folded precursor RNA yielding a GAM336855 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336855 RNA, hereby incorporated herein.

GAM336855 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336855 target RNA, herein designated GAM TARGET RNA.

GAM336855 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336855 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336855 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336855 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336855 RNA, herein designated GAM RNA, to target binding sites on GAM336855 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336855 target RNA into GAM336855 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336855 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336855 target genes. The mRNA of each one of this plurality of GAM336855 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336855 RNA, herein designated GAM RNA, and which when bound by GAM336855 RNA causes inhibition of translation of the GAM336855 target mRNA into a corresponding GAM336855 target protein.

The mechanism of the translational inhibition exerted by GAM336855 RNA, herein designated GAM RNA, on one or more GAM336855 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336855 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336855 RNA, herein designated GAM RNA, of GAM336855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336855 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336855 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336855 RNA correlate with, and may be deduced from, the identity of the GAM336855 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336857 7075 TCTGTCTCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTTTGCCAC Messenger 336857 (GAM336857) oligonucleotides modulates expression of respective target
CCAGGCTGGA genes whose function and utility is known in the art.

ATGTAGTGGT GAM336857 is a novel bioinformatically detectable regulatory, non protein
GTGATCACAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336857 was detected
CTCACTACAG is described with additional reference to Figs. 9-15.

CCTGGATTCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCACACAGGA encoded by the human genome.

ATCAGAGTCA GAM336857 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GA GAM336857 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336857 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336857 precursor RNA is designated SEQ ID:7075, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7075 is located from position 49351290 to position 49351391 relative to chromosome 17 on the `-` strand.

GAM336857 precursor RNA folds onto itself, forming GAM336857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336857 precursor RNA, designated SEQ ID NO: 7075, and a schematic representation of a predicted secondary folding of GAM336857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336857 folded precursor RNA yielding a GAM336857 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336857 RNA, hereby incorporated herein.

GAM336857 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336857 target RNA, herein designated GAM TARGET RNA.

GAM336857 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336857 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336857 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336857 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336857 RNA, herein designated GAM RNA, to target binding sites on GAM336857 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336857 target RNA into GAM336857 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336857 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336857 target genes. The mRNA of each one of this plurality of GAM336857 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336857 RNA, herein designated GAM RNA, and which when bound by GAM336857 RNA causes inhibition of translation of the GAM336857 target mRNA into a corresponding GAM336857 target protein.

The mechanism of the translational inhibition exerted by GAM336857 RNA, herein designated GAM RNA, on one or more GAM336857 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336857 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336857 RNA, herein designated GAM RNA, of GAM336857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336857 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336857 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336857 RNA correlate with, and may be deduced from, the identity of the GAM336857 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336860 5869 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336860 (GAM336860) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336860 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336860 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336860 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336860 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336860 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336860 precursor RNA is designated SEQ ID:5869, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5869 is located from position 49440469 to position 49440550 relative to chromosome X on the `+` strand.

GAM336860 precursor RNA folds onto itself, forming GAM336860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336860 precursor RNA, designated SEQ ID NO: 5869, and a schematic representation of a predicted secondary folding of GAM336860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336860 folded precursor RNA yielding a GAM336860 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336860 RNA, hereby incorporated herein.

GAM336860 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336860 target RNA, herein designated GAM TARGET RNA.

GAM336860 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336860 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336860 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336860 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336860 RNA, herein designated GAM RNA, to target binding sites on GAM336860 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336860 target RNA into GAM336860 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336860 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336860 target genes. The mRNA of each one of this plurality of GAM336860 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336860 RNA, herein designated GAM RNA, and which when bound by GAM336860 RNA causes inhibition of translation of the GAM336860 target mRNA into a corresponding GAM336860 target protein.

The mechanism of the translational inhibition exerted by GAM336860 RNA, herein designated GAM RNA, on one or more GAM336860 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336860 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336860 RNA, herein designated GAM RNA, of GAM336860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336860 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336860 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336860 RNA correlate with, and may be deduced from, the identity of the GAM336860 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336861 6146 CGGGTGAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

AGTGTTATTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TCAGGGTCTC Messenger 336861 (GAM336861) oligonucleotides modulates expression of respective target

CCTTTCAGAA genes whose function and utility is known in the art.

GGCCTTGGGG GAM336861 is a novel bioinformatically detectable regulatory, non protein

CCAAGGGGAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336861 was detected

GAGCTGGAAT is described with additional reference to Figs. 9-15.

TGCCTTCCAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGCGTG encoded by the human genome.

GAM336861 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336861 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336861 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336861 precursor RNA is designated SEQ ID:6146, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6146 is located from position 49549736 to position 49549821 relative to chromosome 20 on the `+` strand.

GAM336861 precursor RNA folds onto itself, forming GAM336861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336861 precursor RNA, designated SEQ ID NO: 6146, and a schematic representation of a predicted secondary folding of GAM336861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336861 folded precursor RNA yielding a GAM336861 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336861 RNA, hereby incorporated herein.

GAM336861 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336861 target RNA, herein designated GAM TARGET RNA.

GAM336861 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336861 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336861 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336861 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336861 RNA, herein designated GAM RNA, to target binding sites on GAM336861 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336861 target RNA into GAM336861 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336861 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336861 target genes. The mRNA of each one of this plurality of GAM336861 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336861 RNA, herein designated GAM RNA, and which when bound by GAM336861 RNA causes inhibition of translation of the GAM336861 target mRNA into a corresponding GAM336861 target protein.

The mechanism of the translational inhibition exerted by GAM336861 RNA, herein designated GAM RNA, on one or more GAM336861 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336861 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336861 RNA, herein designated GAM RNA, of GAM336861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336861 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336861 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336861 RNA correlate with, and may be deduced from, the identity of the GAM336861 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336862 6843 GGTGAGGAAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTTATTGTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGGGTCTCCC Messenger 336862 (GAM336862) oligonucleotides modulates expression of respective target

TTTCAGAAGG genes whose function and utility is known in the art.

CCTTGGGGCC GAM336862 is a novel bioinformatically detectable regulatory, non protein

AAGGGGAGGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336862 was detected

GCTGGAATTG is described with additional reference to Figs. 9-15.

CCTTCCACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336862 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336862 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336862 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336862 precursor RNA is designated SEQ ID:6843, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6843 is located from position 49549738 to position 49549816 relative to chromosome 20 on the `+` strand.

GAM336862 precursor RNA folds onto itself, forming GAM336862 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336862 precursor RNA, designated SEQ ID NO: 6843, and a schematic representation of a predicted secondary folding of GAM336862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336862 folded precursor RNA yielding a GAM336862 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336862 RNA, hereby incorporated herein.

GAM336862 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336862 target RNA, herein designated GAM TARGET RNA.

GAM336862 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336862 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336862 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336862 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336862 RNA, herein designated GAM RNA, to target binding sites on GAM336862 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336862 target RNA into GAM336862 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336862 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336862 target genes. The mRNA of each one of this plurality of GAM336862 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336862 RNA,

herein designated GAM RNA, and which when bound by GAM336862 RNA causes inhibition of translation of the GAM336862 target mRNA into a corresponding GAM336862 target protein.

The mechanism of the translational inhibition exerted by GAM336862 RNA, herein designated GAM RNA, on one or more GAM336862 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336862 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336862 RNA, herein designated GAM RNA, of GAM336862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336862 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336862 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336862 RNA correlate with, and may be deduced from, the identity of the GAM336862 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336863 5714 AGAATCACTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GAACCTGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGTGGAGGTT Messenger 336863 (GAM336863) oligonucleotides modulates expression of respective target

GCAGTGAGCC genes whose function and utility is known in the art.

GAAATTGTGC GAM336863 is a novel bioinformatically detectable regulatory, non protein

CACTGCACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336863 was detected

CAGTCTAGGT is described with additional reference to Figs. 9-15.

GACAGAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GACT encoded by the human genome.

GAM336863 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336863 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336863 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336863 precursor RNA is designated SEQ ID:5714, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5714 is located from position 49602636 to position 49602719 relative to chromosome 17 on the `-` strand.

GAM336863 precursor RNA folds onto itself, forming GAM336863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336863 precursor RNA, designated SEQ ID NO: 5714, and a schematic representation of a predicted secondary folding of GAM336863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336863 folded precursor RNA yielding a GAM336863 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336863 RNA, hereby incorporated herein.

GAM336863 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336863 target RNA, herein designated GAM TARGET RNA.

GAM336863 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336863 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336863 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336863 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336863 RNA, herein designated GAM RNA, to target binding sites on GAM336863 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336863 target RNA

into GAM336863 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336863 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336863 target genes. The mRNA of each one of this plurality of GAM336863 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336863 RNA, herein designated GAM RNA, and which when bound by GAM336863 RNA causes inhibition of translation of the GAM336863 target mRNA into a corresponding GAM336863 target protein.

The mechanism of the translational inhibition exerted by GAM336863 RNA, herein designated GAM RNA, on one or more GAM336863 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336863 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336863 RNA, herein designated GAM RNA, of GAM336863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336863 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336863 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336863 RNA correlate with, and may be deduced from, the identity of the GAM336863 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336864 6757 GGCGTGAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAGCATGAA detected oligonucleotides of the present invention, referred to here as Genomic Address

AAATCCAGGA Messenger 336864 (GAM336864) oligonucleotides modulates expression of respective target

TAAAATCATC genes whose function and utility is known in the art.

ATCAGGGAAA GAM336864 is a novel bioinformatically detectable regulatory, non protein

CTCCTATGAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336864 was detected

GCTGGAACTG is described with additional reference to Figs. 9-15.

GACAACAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTTTAGATCC encoded by the human genome.

CTAGTCATGC GAM336864 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

C GAM336864 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336864 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336864 precursor RNA is designated SEQ ID:6757, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6757 is located from position 49753165 to position 49753265 relative to chromosome 18 on the `-` strand.

GAM336864 precursor RNA folds onto itself, forming GAM336864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336864 precursor RNA, designated SEQ ID NO: 6757, and a schematic representation of a predicted secondary folding of GAM336864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336864 folded precursor RNA yielding a GAM336864 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336864 RNA, hereby incorporated herein.

GAM336864 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336864 target RNA, herein designated GAM TARGET RNA.

GAM336864 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336864 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336864 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336864 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336864 RNA, herein designated GAM RNA, to target binding sites on GAM336864 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336864 target RNA into GAM336864 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336864 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336864 target genes. The mRNA of each one of this plurality of GAM336864 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336864 RNA, herein designated GAM RNA, and which when bound by GAM336864 RNA causes inhibition of translation of the GAM336864 target mRNA into a corresponding GAM336864 target protein.

The mechanism of the translational inhibition exerted by GAM336864 RNA, herein designated GAM RNA, on one or more GAM336864 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336864 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336864 RNA, herein designated GAM RNA, of GAM336864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336864 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336864 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336864 RNA correlate with, and may be deduced from, the identity of the GAM336864 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGGTAGCAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GAATTAACAT Messenger 336866 (GAM336866) oligonucleotides modulates expression of respective target

TCTTGTCAGC genes whose function and utility is known in the art.

AGAGAATGAA GAM336866 is a novel bioinformatically detectable regulatory, non protein
GCAGGAATAT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336866 was
detected
AATTAAAACT is described with additional reference to Figs. 9-15.

TTGCCCTTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a
humen gene
AATAGCTGAT encoded by the human genome.

GAM336866 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336866 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336866 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336866 precursor RNA is designated SEQ ID:6870, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6870 is located from position 50086828 to position 50086917 relative to chromosome 20 on the `+` strand.

GAM336866 precursor RNA folds onto itself, forming GAM336866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336866 precursor RNA, designated SEQ ID NO: 6870, and a schematic representation of a predicted secondary folding of GAM336866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336866 folded precursor RNA yielding a GAM336866 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336866 RNA, hereby incorporated herein.

GAM336866 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336866 target RNA, herein designated GAM TARGET RNA.

GAM336866 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336866 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336866 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336866 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336866 RNA, herein designated GAM RNA, to target binding sites on GAM336866 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336866 target RNA into GAM336866 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336866 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336866 target genes. The mRNA of each one of this plurality of GAM336866 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336866 RNA, herein designated GAM RNA, and which when bound by GAM336866 RNA causes inhibition of translation of the GAM336866 target mRNA into a corresponding GAM336866 target protein.

The mechanism of the translational inhibition exerted by GAM336866 RNA, herein designated GAM RNA, on one or more GAM336866 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336866 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336866 RNA, herein designated GAM RNA, of GAM336866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336866 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336866 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336866 RNA correlate with, and may be deduced from, the identity of the GAM336866 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336867 6809 GGGGACATAA Fig. 8 further provides a conceptual description of another novel bioinformatically
CCGTAGGTGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CCGTGCCAAC Messenger 336867 (GAM336867) oligonucleotides modulates expression of respective target
AGGAAACCCC genes whose function and utility is known in the art.

AGGAAGTCTG GAM336867 is a novel bioinformatically detectable regulatory, non protein
GCTTCAGAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336867 was detected
CATTCCCTTT is described with additional reference to Figs. 9-15.

AGCTCTGATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCACACTGTC encoded by the human genome.

TTGTAGTTCA GAM336867 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GTCTTC GAM336867 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336867 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336867 precursor RNA is designated SEQ ID:6809, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6809 is located from position 50178453 to position 50178558 relative to chromosome 16 on the `+` strand.

GAM336867 precursor RNA folds onto itself, forming GAM336867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336867 precursor RNA, designated SEQ ID NO: 6809, and a schematic representation of a predicted secondary folding of GAM336867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336867 folded precursor RNA yielding a GAM336867 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336867 RNA, hereby incorporated herein.

GAM336867 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM336867 target RNA, herein designated GAM TARGET RNA.

GAM336867 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336867 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336867 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336867 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336867 RNA, herein designated GAM RNA, to target binding sites on GAM336867 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336867 target RNA into GAM336867 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336867 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336867 target genes. The mRNA of each one of this plurality of GAM336867 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336867 RNA, herein designated GAM RNA, and which when bound by GAM336867 RNA causes inhibition of translation of the GAM336867 target mRNA into a corresponding GAM336867 target protein.

The mechanism of the translational inhibition exerted by GAM336867 RNA, herein designated GAM RNA, on one or more GAM336867 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336867 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336867 RNA, herein designated GAM RNA, of GAM336867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336867 target RNA, herein designated

GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336867 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336867 RNA correlate with, and may be deduced from, the identity of the GAM336867 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336868 6640 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGTGGAGG Messenger 336868 (GAM336868) oligonucleotides modulates expression of respective target
TTGTGGTGAG genes whose function and utility is known in the art.

CCAAGATCGT GAM336868 is a novel bioinformatically detectable regulatory, non protein
GACATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336868 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GAGATTCC encoded by the human genome.

GAM336868 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336868 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336868 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336868 precursor RNA is designated SEQ ID:6640, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6640 is located from position 50244509 to position 50244596 relative to chromosome 12 on the `+` strand.

GAM336868 precursor RNA folds onto itself, forming GAM336868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336868 precursor RNA, designated SEQ ID NO: 6640, and a schematic representation of a predicted secondary folding of GAM336868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336868 folded precursor RNA yielding a GAM336868 RNA, herein designated GAM RNA, in the form of a single stranded

~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336868 RNA, hereby incorporated herein. Expression of GAM336868 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336868 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336868 target RNA, herein designated GAM TARGET RNA.

GAM336868 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336868 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336868 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336868 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336868 RNA, herein designated GAM RNA, to target binding sites on GAM336868 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336868 target RNA into GAM336868 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336868 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336868 target genes. The mRNA of each one of this plurality of GAM336868 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336868 RNA, herein designated GAM RNA, and which when bound by GAM336868 RNA causes inhibition of translation of the GAM336868 target mRNA into a corresponding GAM336868 target protein.

The mechanism of the translational inhibition exerted by GAM336868 RNA, herein designated GAM RNA, on one or more GAM336868 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336868 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336868 RNA, herein designated GAM RNA, of GAM336868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336868 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336868 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336868 RNA correlate with, and may be deduced from, the identity of the GAM336868 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336869 7002 TCACTTGAAC CCGGGAGGCG GAGGTTGCAG TGAGCTGAGG TCGTGCCACT GCACTCCAGC CTGGGCAACA AGAGTGA

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336869 (GAM336869) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336869 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336869 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336869 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336869 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336869 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336869 precursor RNA is designated SEQ ID:7002, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7002 is located from position 50257437 to position 50257513 relative to chromosome 19 on the `-` strand.

GAM336869 precursor RNA folds onto itself, forming GAM336869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336869 precursor RNA, designated SEQ ID NO: 7002, and a schematic representation of a predicted secondary folding of GAM336869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336869 folded precursor RNA yielding a GAM336869 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336869 RNA, hereby incorporated herein. Expression of GAM336869 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336869 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336869 target RNA, herein designated GAM TARGET RNA.

GAM336869 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336869 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336869 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336869 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336869 RNA, herein designated GAM RNA, to target binding sites on GAM336869 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336869 target RNA into GAM336869 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336869 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336869 target genes. The mRNA of each one of this plurality of GAM336869 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336869 RNA, herein designated GAM RNA, and which when bound by GAM336869 RNA causes inhibition of translation of the GAM336869 target mRNA into a corresponding GAM336869 target protein.

The mechanism of the translational inhibition exerted by GAM336869 RNA, herein designated GAM RNA, on one or more GAM336869 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336869 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336869 RNA, herein designated GAM RNA, of GAM336869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336869 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336869 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336869 RNA correlate with, and may be deduced from, the identity of the GAM336869 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336870 6630 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGCGGAGG Messenger 336870 (GAM336870) oligonucleotides modulates expression of respective target

TTGCAGTGAG genes whose function and utility is known in the art.

CTGAGATTGC GAM336870 is a novel bioinformatically detectable regulatory, non protein

ACTATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336870 was detected

TCCAGTCTGG is described with additional reference to Figs. 9-15.

GTGACAGAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACTCC encoded by the human genome.

GAM336870 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336870 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336870 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336870 precursor RNA is designated SEQ

ID:6630, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6630 is located from position 50356669 to position 50356756 relative to chromosome 12 on the `+` strand.

GAM336870 precursor RNA folds onto itself, forming GAM336870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336870 precursor RNA, designated SEQ ID NO: 6630, and a schematic representation of a predicted secondary folding of GAM336870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336870 folded precursor RNA yielding a GAM336870 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336870 RNA, hereby incorporated herein.

GAM336870 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336870 target RNA, herein designated GAM TARGET RNA.

GAM336870 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336870 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336870 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336870 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336870 RNA, herein designated GAM RNA, to target binding sites on GAM336870 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336870 target RNA into GAM336870 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336870 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336870 target genes. The mRNA of each one of this plurality of GAM336870 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336870 RNA, herein designated GAM RNA, and which when bound by GAM336870 RNA causes inhibition of translation of the GAM336870 target mRNA into a corresponding GAM336870 target protein.

The mechanism of the translational inhibition exerted by GAM336870 RNA, herein designated GAM RNA, on one or more GAM336870 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336870 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336870 RNA, herein designated GAM RNA, of GAM336870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336870 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336870 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336870 RNA correlate with, and may be deduced from, the identity of the GAM336870 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336871 7228 TGGCTCACAC Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGTAATCCC detected oligonucleotides of the present invention, referred to here as Genomic Address

CGCTACTCAG Messenger 336871 (GAM336871) oligonucleotides modulates expression of respective target

GAGGTTTAGG genes whose function and utility is known in the art.

CAGGAGAATC GAM336871 is a novel bioinformatically detectable regulatory, non protein

ACTTGAACCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336871 was detected

GAGAGGCAGA is described with additional reference to Figs. 9-15.

GGTTACAGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GTGAGTCA encoded by the human genome.

GAM336871 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336871 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336871 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336871 precursor RNA is designated SEQ ID:7228, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7228 is located from position 50415753 to position 50415840 relative to chromosome 12 on the `+` strand.

GAM336871 precursor RNA folds onto itself, forming GAM336871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336871 precursor RNA, designated SEQ ID NO: 7228, and a schematic representation of a predicted secondary folding of GAM336871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336871 folded precursor RNA yielding a GAM336871 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336871 RNA, hereby incorporated herein.

GAM336871 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336871 target RNA, herein designated GAM TARGET RNA.

GAM336871 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336871 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336871 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336871 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336871 RNA, herein designated GAM RNA, to target binding sites on GAM336871 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336871 target RNA into GAM336871 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336871 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336871 target genes. The mRNA of each one of this plurality of GAM336871 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336871 RNA, herein designated GAM RNA, and which when bound by GAM336871 RNA causes inhibition of translation of the GAM336871 target mRNA into a corresponding GAM336871 target protein.

The mechanism of the translational inhibition exerted by GAM336871 RNA, herein designated GAM RNA, on one or more GAM336871 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336871 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336871 RNA, herein designated GAM RNA, of GAM336871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336871 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336871 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336871 RNA correlate with, and may be deduced from, the identity of the GAM336871 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336872 6853 GGTGGTTATG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTGTAGTCT Messenger 336872 (GAM336872) oligonucleotides modulates expression of respective target

CATCTGCTTT genes whose function and utility is known in the art.

GGAGTTGAGG GAM336872 is a novel bioinformatically detectable regulatory, non protein
CTGCAGTGAA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336872 was detected
CTATGATCGT is described with additional reference to Figs. 9-15.

GCCACT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336872 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336872 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336872 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336872 precursor RNA is designated SEQ ID:6853, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6853 is located from position 50638127 to position 50638202 relative to chromosome 12 on the `+` strand.

GAM336872 precursor RNA folds onto itself, forming GAM336872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336872 precursor RNA, designated SEQ ID NO: 6853, and a schematic representation of a predicted secondary folding of GAM336872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336872 folded precursor RNA yielding a GAM336872 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336872 RNA, hereby incorporated herein.

GAM336872 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336872 target RNA, herein designated GAM TARGET RNA.

GAM336872 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336872 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336872 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336872 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336872 RNA, herein designated GAM RNA, to target binding sites on GAM336872 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336872 target RNA into GAM336872 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336872 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336872 target genes. The mRNA of each one of this plurality of GAM336872 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336872 RNA, herein designated GAM RNA, and which when bound by GAM336872 RNA causes inhibition of translation of the GAM336872 target mRNA into a corresponding GAM336872 target protein.

The mechanism of the translational inhibition exerted by GAM336872 RNA, herein designated GAM RNA, on one or more GAM336872 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336872 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336872 RNA, herein designated GAM RNA, of GAM336872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336872 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336872 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336872 RNA correlate with, and may be deduced from, the identity of the GAM336872 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336873 7334 TTGGGCTACT Fig. 8 further provides a conceptual description of another novel bioinformatically
TATAGGAGTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AAAATAAACT Messenger 336873 (GAM336873) oligonucleotides modulates expression of respective target
CTGTGATGTG genes whose function and utility is known in the art.

CCAGCACCAG GAM336873 is a novel bioinformatically detectable regulatory, non protein
CACAGGCTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336873 was detected
TGTAGTTTCC is described with additional reference to Figs. 9-15.

TCCCAACTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGGCTCAG encoded by the human genome.

GAM336873 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336873 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336873 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336873 precursor RNA is designated SEQ ID:7334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7334 is located from position 50704929 to position 50705016 relative to chromosome 8 on the `+` strand.

GAM336873 precursor RNA folds onto itself, forming GAM336873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336873 precursor RNA, designated SEQ ID NO: 7334, and a schematic representation of a predicted secondary folding of GAM336873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336873 folded precursor RNA yielding a GAM336873 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336873 RNA, hereby incorporated herein.

GAM336873 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336873 target RNA, herein designated GAM TARGET RNA.

GAM336873 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336873 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336873 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336873 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336873 RNA, herein designated GAM RNA, to target binding sites on GAM336873 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336873 target RNA into GAM336873 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336873 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336873 target genes. The mRNA of each one of this plurality of GAM336873 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336873 RNA, herein designated GAM RNA, and which when bound by GAM336873 RNA causes inhibition of translation of the GAM336873 target mRNA into a corresponding GAM336873 target protein.

The mechanism of the translational inhibition exerted by GAM336873 RNA, herein designated GAM RNA, on one or more GAM336873 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336873 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336873 RNA, herein designated GAM RNA, of GAM336873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336873 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336873 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336873 RNA correlate with, and may be deduced from, the identity of the GAM336873 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336874 6768 GGCTTCCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

CTCAGATTCA Messenger 336874 (GAM336874) oligonucleotides modulates expression of respective target
AAGGAACAAA genes whose function and utility is known in the art.

GTGGCCCCAG GAM336874 is a novel bioinformatically detectable regulatory, non protein
TCAGCCTTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336874 was detected
CCAGAAACCT is described with additional reference to Figs. 9-15.

GTGAGTGTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGCTGGAAG encoded by the human genome.

CC GAM336874 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336874 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336874 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336874 precursor RNA is designated SEQ ID:6768, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6768 is located from position 50706273 to position 50706364 relative to chromosome 10 on the `-` strand.

GAM336874 precursor RNA folds onto itself, forming GAM336874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336874 precursor RNA, designated SEQ ID NO: 6768, and a schematic representation of a predicted secondary folding of GAM336874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336874 folded precursor RNA yielding a GAM336874 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336874 RNA, hereby incorporated herein.

GAM336874 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336874 target RNA, herein designated GAM TARGET RNA.

GAM336874 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336874 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336874 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336874 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336874 RNA, herein designated GAM RNA, to target binding sites on GAM336874 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336874 target RNA into GAM336874 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336874 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336874 target genes. The mRNA of each one of this plurality of GAM336874 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336874 RNA, herein designated GAM RNA, and which when bound by GAM336874 RNA causes inhibition of translation of the GAM336874 target mRNA into a corresponding GAM336874 target protein.

The mechanism of the translational inhibition exerted by GAM336874 RNA, herein designated GAM RNA, on one or more GAM336874 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336874 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336874 RNA, herein designated GAM RNA, of GAM336874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336874 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336874 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336874 RNA correlate with, and may be deduced from, the identity of the GAM336874 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336875 6538 GCTCTTCCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTAGTCTGG GAM336875 is a novel bioinformatically detectable regulatory, non protein
GCTTTCTCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336875 was detected
CGATTGGCTG is described with additional reference to Figs. 9-15.

AGGCAGCAAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGGTGAGGCA encoded by the human genome.

CCTGGGCTGT GAM336875 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GCAGGAGC GAM336875 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336875 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336875 precursor RNA is designated SEQ ID:6538, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6538 is located from position 50833625 to position 50833732 relative to chromosome 10 on the `-` strand.

GAM336875 precursor RNA folds onto itself, forming GAM336875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336875 precursor RNA, designated SEQ ID NO: 6538, and a schematic representation of a predicted secondary folding of GAM336875 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336875 folded precursor RNA yielding a GAM336875 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336875 RNA, hereby incorporated herein.

GAM336875 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336875 target RNA, herein designated GAM TARGET RNA.

GAM336875 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336875 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336875 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336875 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336875 RNA, herein designated GAM RNA, to target binding sites on GAM336875 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336875 target RNA into GAM336875 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336875 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336875 target genes. The mRNA of each one of this plurality of GAM336875 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336875 RNA, herein designated GAM RNA, and which when bound by GAM336875 RNA causes inhibition of translation of the GAM336875 target mRNA into a corresponding GAM336875 target protein.

The mechanism of the translational inhibition exerted by GAM336875 RNA, herein designated GAM RNA, on one or more GAM336875 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336875 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336875 RNA, herein designated GAM RNA, of GAM336875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336875 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336875 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336875 RNA correlate with, and may be deduced from, the identity of the GAM336875 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336876 5984 CAAATCAGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

GCATATTAGA detected oligonucleotides of the present invention, referred to here as Genomic Address

TTCTCATAGG Messenger 336876 (GAM336876) oligonucleotides modulates expression of respective target

AATGTGAACC genes whose function and utility is known in the art.

GTGTTGTGAC GAM336876 is a novel bioinformatically detectable regulatory, non protein

CATGCGAGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336876 was detected

ATCTAGGTTG is described with additional reference to Figs. 9-15.

CATGCTCTTC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATGAGAATCT encoded by the human genome.

AATATCTGAT GAM336876 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GATCTG GAM336876 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336876 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336876 precursor RNA is designated SEQ ID:5984, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5984 is located from position 50911119 to position 50911224 relative to chromosome 12 on the `+` strand.

GAM336876 precursor RNA folds onto itself, forming GAM336876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336876 precursor RNA, designated SEQ ID NO: 5984, and a schematic representation of a predicted secondary folding of GAM336876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336876 folded precursor RNA yielding a GAM336876 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336876 RNA, hereby incorporated herein.

GAM336876 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336876 target RNA, herein designated GAM TARGET RNA.

GAM336876 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336876 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336876 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336876 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336876 RNA, herein designated GAM RNA, to target binding sites on GAM336876 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336876 target RNA into GAM336876 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336876 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336876 target genes. The mRNA of each one of this plurality of GAM336876 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336876 RNA, herein designated GAM RNA, and which when bound by GAM336876 RNA causes inhibition of translation of the GAM336876 target mRNA into a corresponding GAM336876 target protein.

The mechanism of the translational inhibition exerted by GAM336876 RNA, herein designated GAM RNA, on one or more GAM336876 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336876 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336876 RNA, herein designated GAM RNA, of GAM336876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336876 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336876 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336876 RNA correlate with, and may be deduced from, the identity of the GAM336876 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336877 5955 ATCAGTGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

TATTAGATTC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCATAGGAAT Messenger 336877 (GAM336877) oligonucleotides modulates expression of respective target

GTGAACCGTG genes whose function and utility is known in the art.

TTGTGACCAT GAM336877 is a novel bioinformatically detectable regulatory, non protein

GCGAGGGATC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336877 was detected

TAGGTTGCAT is described with additional reference to Figs. 9-15.

GCTCTTCATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGAATCTAAT encoded by the human genome.

ATCTGAT GAM336877 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336877 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336877 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336877 precursor RNA is designated SEQ ID:5955, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5955 is located from position 50911122 to position 50911218 relative to chromosome 12 on the `+` strand.

GAM336877 precursor RNA folds onto itself, forming GAM336877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336877 precursor RNA, designated SEQ ID NO: 5955, and a schematic representation of a predicted secondary folding of GAM336877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336877 folded precursor RNA yielding a GAM336877 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336877 RNA, hereby incorporated herein.

GAM336877 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336877 target RNA, herein designated GAM TARGET RNA.

GAM336877 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336877 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336877 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336877 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336877 RNA, herein designated GAM RNA, to target binding sites on GAM336877 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336877 target RNA into GAM336877 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336877 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336877 target genes. The mRNA of each one of this plurality of GAM336877 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336877 RNA, herein designated GAM RNA, and which when bound by GAM336877 RNA causes inhibition of translation of the GAM336877 target mRNA into a corresponding GAM336877 target protein.

The mechanism of the translational inhibition exerted by GAM336877 RNA, herein designated GAM RNA, on one or more GAM336877 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336877 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336877 RNA, herein designated GAM RNA, of GAM336877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336877 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336877 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336877 RNA correlate with, and may be deduced from, the identity of the GAM336877 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336878 6971 TAGGAGGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GTCCAGGAGT Messenger 336878 (GAM336878) oligonucleotides modulates expression of respective target

TGAAGGCTAC genes whose function and utility is known in the art.

AGTGAGCTTT GAM336878 is a novel bioinformatically detectable regulatory, non protein

GATCACATCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336878 was detected

CTGCACTCTA is described with additional reference to Figs. 9-15.

GCCTGAGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAAGCAAGA encoded by the human genome.

CCTCATCTCT GAM336878 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TA GAM336878 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336878 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336878 precursor RNA is designated SEQ ID:6971, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6971 is located from position 51269225 to position 51269326 relative to chromosome 13 on the `+` strand.

GAM336878 precursor RNA folds onto itself, forming GAM336878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336878 precursor RNA, designated SEQ ID NO: 6971, and a schematic representation of a predicted secondary folding of GAM336878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336878 folded precursor RNA yielding a GAM336878 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336878 RNA, hereby incorporated herein.

GAM336878 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336878 target RNA, herein designated GAM TARGET RNA.

GAM336878 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336878 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336878 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336878 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336878 RNA, herein designated GAM RNA, to target binding sites on GAM336878 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336878 target RNA into GAM336878 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336878 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336878 target genes. The mRNA of each one of this plurality of GAM336878 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336878 RNA, herein designated GAM RNA, and which when bound by GAM336878 RNA causes inhibition of translation of the GAM336878 target mRNA into a corresponding GAM336878 target protein.

The mechanism of the translational inhibition exerted by GAM336878 RNA, herein designated GAM RNA, on one or more GAM336878 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336878 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336878 RNA, herein designated GAM RNA, of GAM336878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336878 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336878 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336878 RNA correlate with, and may be deduced from, the identity of the GAM336878 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336879 7048 TCGCTCTTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGCATGATC genes whose function and utility is known in the art.

TCGGCTCACT GCAACCTCTG CCTCCTGGGT

GAM336879 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336879 was detected is described with additional reference to Figs. 9-15.

TCAAGCGA

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336879 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336879 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336879 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336879 precursor RNA is designated SEQ ID:7048, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7048 is located from position 51538284 to position 51538361 relative to chromosome 10 on the `-` strand.

GAM336879 precursor RNA folds onto itself, forming GAM336879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336879 precursor RNA, designated SEQ ID NO: 7048, and a schematic representation of a predicted secondary folding of GAM336879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336879 folded precursor RNA yielding a GAM336879 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM336879 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336879 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM336879 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336879 target RNA, herein designated GAM TARGET RNA.

GAM336879 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336879 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336879 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336879 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336879 RNA, herein designated GAM RNA, to target binding sites on GAM336879 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336879 target RNA into GAM336879 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336879 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336879 target genes. The mRNA of each one of this plurality of GAM336879 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336879 RNA, herein designated GAM RNA, and which when bound by GAM336879 RNA causes inhibition of translation of the GAM336879 target mRNA into a corresponding GAM336879 target protein.

The mechanism of the translational inhibition exerted by GAM336879 RNA, herein designated GAM RNA, on one or more GAM336879 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336879 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336879 RNA, herein designated GAM RNA, of GAM336879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336879 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336879 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336879 RNA correlate with, and may be deduced from, the identity of the GAM336879 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336880 6382 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACCCAGGAGA Messenger 336880 (GAM336880) oligonucleotides modulates expression of respective target

CGGAGGTTGT genes whose function and utility is known in the art.

TGTGAGCCGA GAM336880 is a novel bioinformatically detectable regulatory, non protein

GATCGCGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336880 was detected

TTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CGAGCGAAAC encoded by the human genome.

TCCGTCTC GAM336880 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336880 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336880 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336880 precursor RNA is designated SEQ ID:6382, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6382 is located from position 51698913 to position 51699010 relative to chromosome 10 on the `-` strand.

GAM336880 precursor RNA folds onto itself, forming GAM336880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336880 precursor RNA, designated SEQ ID NO: 6382, and a schematic representation of a predicted secondary folding of GAM336880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336880 folded precursor RNA yielding a GAM336880 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336880 RNA, hereby incorporated herein. Expression of GAM336880 RNA was experimentally validated in HeLa cells using the methods

described with reference to Figs.22 to 24.

GAM336880 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336880 target RNA, herein designated GAM TARGET RNA.

GAM336880 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336880 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336880 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336880 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336880 RNA, herein designated GAM RNA, to target binding sites on GAM336880 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336880 target RNA into GAM336880 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336880 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336880 target genes. The mRNA of each one of this plurality of GAM336880 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336880 RNA, herein designated GAM RNA, and which when bound by GAM336880 RNA causes inhibition of translation of the GAM336880 target mRNA into a corresponding GAM336880 target protein.

The mechanism of the translational inhibition exerted by GAM336880 RNA, herein designated GAM RNA, on one or more GAM336880 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336880 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336880 RNA, herein designated GAM RNA, of GAM336880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336880 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336880 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336880 RNA correlate with, and may be deduced from, the identity of the GAM336880 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TTCTGTTGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336882 was detected
TTCTAGCCCT is described with additional reference to Figs. 9-15.

ACCTTTTCTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GACACATTCA encoded by the human genome.

TGCTAGAGGG GAM336882 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
AT GAM336882 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336882 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336882 precursor RNA is designated SEQ ID:6887, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6887 is located from position 51927028 to position 51927129 relative to chromosome 19 on the `+` strand.

GAM336882 precursor RNA folds onto itself, forming GAM336882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336882 precursor RNA, designated SEQ ID NO: 6887, and a schematic representation of a predicted secondary folding of GAM336882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336882 folded precursor RNA yielding a GAM336882 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336882 RNA, hereby incorporated herein.

GAM336882 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336882 target RNA, herein designated GAM TARGET RNA.

GAM336882 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336882 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336882 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336882 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336882 RNA, herein designated GAM RNA, to target binding sites on GAM336882 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336882 target RNA into GAM336882 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336882 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336882 target genes. The mRNA of each one of this plurality of GAM336882 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336882 RNA, herein designated GAM RNA, and which when bound by GAM336882 RNA causes inhibition of translation of the GAM336882 target mRNA into a corresponding GAM336882 target protein.

The mechanism of the translational inhibition exerted by GAM336882 RNA, herein designated GAM RNA, on one or more GAM336882 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336882 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336882 RNA, herein designated GAM RNA, of GAM336882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336882 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336882 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336882 RNA correlate with, and may be deduced from, the identity of the GAM336882 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336883 6013 CAGATAACCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GACACACCCC detected oligonucleotides of the present invention, referred to here as Genomic Address

TGGGCTGGGC Messenger 336883 (GAM336883) oligonucleotides modulates expression of respective target

ACACAGTTCC genes whose function and utility is known in the art.

TTATTTGGGT GAM336883 is a novel bioinformatically detectable regulatory, non protein

TTTGTGGTTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336883 was detected

TCCCAGGTGG is described with additional reference to Figs. 9-15.

TAGCTGGGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTG encoded by the human genome.

GAM336883 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336883 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336883 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336883 precursor RNA is designated SEQ ID:6013, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6013 is located from position 51938752 to position 51938835 relative to chromosome 12 on the `+` strand.

GAM336883 precursor RNA folds onto itself, forming GAM336883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336883 precursor RNA, designated SEQ ID NO: 6013, and a schematic representation of a predicted secondary folding of GAM336883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336883 folded precursor RNA yielding a GAM336883 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336883 RNA, hereby incorporated herein.

GAM336883 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336883 target RNA, herein designated GAM TARGET RNA.

GAM336883 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336883 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336883 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336883 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336883 RNA, herein designated GAM RNA, to target binding sites on GAM336883 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336883 target RNA into GAM336883 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336883 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336883 target genes. The mRNA of each one of this plurality of GAM336883 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336883 RNA, herein designated GAM RNA, and which when bound by GAM336883 RNA causes inhibition of translation of the GAM336883 target mRNA into a corresponding GAM336883 target protein.

The mechanism of the translational inhibition exerted by GAM336883 RNA, herein designated GAM RNA, on one or more GAM336883 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336883 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336883 RNA, herein designated GAM RNA, of GAM336883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336883 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336883 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336883 RNA correlate with, and may be deduced from, the identity of the GAM336883 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336886 6371 GAGGCAAGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATTGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCCGGGAGG Messenger 336886 (GAM336886) oligonucleotides modulates expression of respective target

CGAAGGTTGC genes whose function and utility is known in the art.

AGTGAGCTGA GAM336886 is a novel bioinformatically detectable regulatory, non protein

GATGGTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336886 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGCAAGA encoded by the human genome.

CTGTGTCTC GAM336886 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336886 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336886 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336886 precursor RNA is designated SEQ

ID:6371, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6371 is located from position 52749150 to position 52749248 relative to chromosome 20 on the `+` strand.

GAM336886 precursor RNA folds onto itself, forming GAM336886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336886 precursor RNA, designated SEQ ID NO: 6371, and a schematic representation of a predicted secondary folding of GAM336886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336886 folded precursor RNA yielding a GAM336886 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336886 RNA, hereby incorporated herein. Expression of GAM336886 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336886 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336886 target RNA, herein designated GAM TARGET RNA.

GAM336886 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336886 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336886 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336886 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336886 RNA, herein designated GAM RNA, to target binding sites on GAM336886 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336886 target RNA

into GAM336886 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336886 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336886 target genes. The mRNA of each one of this plurality of GAM336886 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336886 RNA, herein designated GAM RNA, and which when bound by GAM336886 RNA causes inhibition of translation of the GAM336886 target mRNA into a corresponding GAM336886 target protein.

The mechanism of the translational inhibition exerted by GAM336886 RNA, herein designated GAM RNA, on one or more GAM336886 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336886 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336886 RNA, herein designated GAM RNA, of GAM336886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336886 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336886 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336886 RNA correlate with, and may be deduced from, the identity of the GAM336886 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336887 6429 GAGGCAGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

ACTCGCTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACCCAGGAGG Messenger 336887 (GAM336887) oligonucleotides modulates expression of respective target

CGGAGGTTGC genes whose function and utility is known in the art.

AGTGAGGTGA GAM336887 is a novel bioinformatically detectable regulatory, non protein

GATGGCGCTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336887 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGATTGAGA encoded by the human genome.

CTGTCTC GAM336887 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336887 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336887 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336887 precursor RNA is designated SEQ ID:6429, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6429 is located from position 52879973 to position 52880069 relative to chromosome 19 on the `+` strand.

GAM336887 precursor RNA folds onto itself, forming GAM336887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336887 precursor RNA, designated SEQ ID NO: 6429, and a schematic representation of a predicted secondary folding of GAM336887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336887 folded precursor RNA yielding a GAM336887 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336887 RNA, hereby incorporated herein. Expression of GAM336887 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336887 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336887 target RNA, herein designated GAM TARGET RNA.

GAM336887 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336887 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336887 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336887 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336887 RNA, herein designated GAM RNA, to target binding sites on GAM336887 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336887 target RNA into GAM336887 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336887 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336887 target genes. The mRNA of each one of this plurality of GAM336887 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336887 RNA, herein designated GAM RNA, and which when bound by GAM336887 RNA causes inhibition of translation of the GAM336887 target mRNA into a corresponding GAM336887 target protein.

The mechanism of the translational inhibition exerted by GAM336887 RNA, herein designated GAM RNA, on one or more GAM336887 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336887 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336887 RNA, herein designated GAM RNA, of GAM336887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336887 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336887 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336887 RNA correlate with, and may be deduced from, the identity of the GAM336887 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336888 6450 GAGGTAAAGC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGGGGCTGGG detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTCCTTATG Messenger 336888 (GAM336888) oligonucleotides modulates expression of respective target
CAAAGAGAGC genes whose function and utility is known in the art.

TGTCTCTTTA GAM336888 is a novel bioinformatically detectable regulatory, non protein
GTAGGAACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336888 was detected
TGGATTGGCT is described with additional reference to Figs. 9-15.

CATTTTGCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
T encoded by the human genome.

GAM336888 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336888 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336888 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336888 precursor RNA is designated SEQ ID:6450, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6450 is located from position 53047643 to position 53047723 relative to chromosome 10 on the `+` strand.

GAM336888 precursor RNA folds onto itself, forming GAM336888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336888 precursor RNA, designated SEQ ID NO: 6450, and a schematic representation of a predicted secondary folding of GAM336888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336888 folded precursor RNA yielding a GAM336888 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336888 RNA, hereby incorporated herein.

GAM336888 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336888 target RNA, herein designated GAM TARGET RNA.

GAM336888 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336888 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336888 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336888 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336888 RNA, herein designated GAM RNA, to target binding sites on GAM336888 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336888 target RNA into GAM336888 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336888 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336888 target genes. The mRNA of each one of this plurality of GAM336888 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336888 RNA, herein designated GAM RNA, and which when bound by GAM336888 RNA causes inhibition of translation of the GAM336888 target mRNA into a corresponding GAM336888 target protein.

The mechanism of the translational inhibition exerted by GAM336888 RNA, herein designated GAM RNA, on one or more GAM336888 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336888 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336888 RNA, herein designated GAM RNA, of GAM336888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336888 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336888 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336888

RNA correlate with, and may be deduced from, the identity of the GAM336888 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGGTGACATT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AGATACCAGA encoded by the human genome.

CAT GAM336889 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336889 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336889 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336889 precursor RNA is designated SEQ ID:5971, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5971 is located from position 53301337 to position 53301429 relative to chromosome 14 on the `+` strand.

GAM336889 precursor RNA folds onto itself, forming GAM336889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336889 precursor RNA, designated SEQ ID NO: 5971, and a schematic representation of a predicted secondary folding of GAM336889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336889 folded precursor RNA yielding a GAM336889 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336889 RNA, hereby incorporated herein.

GAM336889 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336889 target RNA, herein designated GAM TARGET RNA.

GAM336889 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336889 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336889 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336889 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336889 RNA, herein designated GAM RNA, to target binding sites on GAM336889 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336889 target RNA into GAM336889 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336889 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336889 target genes. The mRNA of each one of this plurality of GAM336889 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336889 RNA, herein designated GAM RNA, and which when bound by GAM336889 RNA causes inhibition of translation of the GAM336889 target mRNA into a corresponding GAM336889 target protein.

The mechanism of the translational inhibition exerted by GAM336889 RNA, herein designated GAM RNA, on one or more GAM336889 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336889 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336889 RNA, herein designated GAM RNA, of GAM336889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336889 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336889 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336889 RNA correlate with, and may be deduced from, the identity of the GAM336889 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336892 7093 TGAGAAGTCA Fig. 8 further provides a conceptual description of another novel bioinformatically
GTCCTGATGG detected oligonucleotides of the present invention, referred to here as Genomic Address
CAGCTGTGCA Messenger 336892 (GAM336892) oligonucleotides modulates expression of respective target
GAGTGGGGGT genes whose function and utility is known in the art.

GAGGAGGCCA GAM336892 is a novel bioinformatically detectable regulatory, non protein
ACTTACTGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336892 was detected
TCCTGAACTG is described with additional reference to Figs. 9-15.

GGCAGTGCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTATGACAT encoded by the human genome.

GGCCA GAM336892 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336892 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336892 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336892 precursor RNA is designated SEQ ID:7093, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7093 is located from position 53823632 to position 53823726 relative to chromosome 12 on the `-` strand.

GAM336892 precursor RNA folds onto itself, forming GAM336892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336892 precursor RNA, designated SEQ ID NO: 7093, and a schematic representation of a predicted secondary folding of GAM336892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336892 folded precursor RNA yielding a GAM336892 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336892 RNA, hereby incorporated herein.

GAM336892 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336892 target RNA, herein designated GAM TARGET RNA.

GAM336892 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336892 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336892 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336892 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336892 RNA, herein designated GAM RNA, to target binding sites on GAM336892 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336892 target RNA into GAM336892 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336892 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336892 target genes. The mRNA of each one of this plurality of GAM336892 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336892 RNA, herein designated GAM RNA, and which when bound by GAM336892 RNA causes inhibition of translation of the GAM336892 target mRNA into a corresponding GAM336892 target protein.

The mechanism of the translational inhibition exerted by GAM336892 RNA, herein designated GAM RNA, on one or more GAM336892 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336892 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336892 folded precursor RNA, herein

designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336892 RNA, herein designated GAM RNA, of GAM336892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336892 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336892 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336892 RNA correlate with, and may be deduced from, the identity of the GAM336892 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336893 6872 GTCAGTCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

ATGGCAGCTG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGCAGAGTGG Messenger 336893 (GAM336893) oligonucleotides modulates expression of respective target

GGGTGAGGAG genes whose function and utility is known in the art.

GCCAACTTAC GAM336893 is a novel bioinformatically detectable regulatory, non protein

TGCTTCCTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336893 was detected

ACTGGGCAGT is described with additional reference to Figs. 9-15.

GCCTTCTATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACATGGC encoded by the human genome.

GAM336893 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336893 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336893 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336893 precursor RNA is designated SEQ ID:6872, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6872 is located from position 53823634 to position 53823720 relative to chromosome 12 on the `-` strand.

GAM336893 precursor RNA folds onto itself, forming GAM336893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336893 precursor RNA, designated SEQ ID NO: 6872, and a schematic representation of a predicted secondary folding of GAM336893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336893 folded precursor RNA yielding a GAM336893 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336893 RNA, hereby incorporated herein.

GAM336893 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336893 target RNA, herein designated GAM TARGET RNA.

GAM336893 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336893 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336893 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336893 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336893 RNA, herein designated GAM RNA, to target binding sites on GAM336893 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336893 target RNA into GAM336893 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336893 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336893 target genes. The mRNA of each one of this plurality of GAM336893 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336893 RNA, herein designated GAM RNA, and which when bound by GAM336893 RNA causes inhibition of translation of the GAM336893 target mRNA into a corresponding GAM336893 target protein.

The mechanism of the translational inhibition exerted by GAM336893 RNA, herein

designated GAM RNA, on one or more GAM336893 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336893 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336893 RNA, herein designated GAM RNA, of GAM336893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336893 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336893 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336893 RNA correlate with, and may be deduced from, the identity of the GAM336893 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336894 5690 ACATATGGCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATGGAAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GATTTCTCCT Messenger 336894 (GAM336894) oligonucleotides modulates expression of respective target

AATGAAAATG genes whose function and utility is known in the art.

AAGTGCTCTT GAM336894 is a novel bioinformatically detectable regulatory, non protein

TTGAGTATTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336894 was detected

CTTGTTTTAT is described with additional reference to Figs. 9-15.

TGAGATTCCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATCTGCCCTT encoded by the human genome.

GT GAM336894 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336894 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336894 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336894 precursor RNA is designated SEQ ID:5690, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5690 is located from position 53863297 to position 53863388

relative to chromosome 8 on the `-` strand.

GAM336894 precursor RNA folds onto itself, forming GAM336894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336894 precursor RNA, designated SEQ ID NO: 5690, and a schematic representation of a predicted secondary folding of GAM336894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336894 folded precursor RNA yielding a GAM336894 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336894 RNA, hereby incorporated herein.

GAM336894 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336894 target RNA, herein designated GAM TARGET RNA.

GAM336894 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336894 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336894 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336894 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336894 RNA, herein designated GAM RNA, to target binding sites on GAM336894 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336894 target RNA into GAM336894 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336894 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336894 target genes. The mRNA of each one of this plurality of GAM336894 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336894 RNA, herein designated GAM RNA, and which when bound by GAM336894 RNA causes inhibition of translation of the GAM336894 target mRNA into a corresponding GAM336894 target protein.

The mechanism of the translational inhibition exerted by GAM336894 RNA, herein designated GAM RNA, on one or more GAM336894 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336894 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336894 RNA, herein designated GAM RNA, of GAM336894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336894 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336894 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336894 RNA correlate with, and may be deduced from, the identity of the GAM336894 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336895 6727 GGCAGAATGG Fig. 8 further provides a conceptual description of another novel bioinformatically
AAGTGATTTC detected oligonucleotides of the present invention, referred to here as Genomic Address
TCCTAATGAA Messenger 336895 (GAM336895) oligonucleotides modulates expression of respective target
AATGAAGTGC genes whose function and utility is known in the art.

TCTTTTGAGT GAM336895 is a novel bioinformatically detectable regulatory, non protein
ATTTCTTGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336895 was detected
TTATTGAGAT is described with additional reference to Figs. 9-15.

TCCTATCTGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
C encoded by the human genome.

GAM336895 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336895 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336895 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336895 precursor RNA is designated SEQ ID:6727, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6727 is located from position 53863302 to position 53863382 relative to chromosome 8 on the `-` strand.

GAM336895 precursor RNA folds onto itself, forming GAM336895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336895 precursor RNA, designated SEQ ID NO: 6727, and a schematic representation of a predicted secondary folding of GAM336895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336895 folded precursor RNA yielding a GAM336895 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336895 RNA, hereby incorporated herein.

GAM336895 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336895 target RNA, herein designated GAM TARGET RNA.

GAM336895 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336895 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336895 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336895 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336895 RNA, herein designated GAM RNA, to target

binding sites on GAM336895 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336895 target RNA into GAM336895 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336895 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336895 target genes. The mRNA of each one of this plurality of GAM336895 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336895 RNA, herein designated GAM RNA, and which when bound by GAM336895 RNA causes inhibition of translation of the GAM336895 target mRNA into a corresponding GAM336895 target protein.

The mechanism of the translational inhibition exerted by GAM336895 RNA, herein designated GAM RNA, on one or more GAM336895 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336895 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336895 RNA, herein designated GAM RNA, of GAM336895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336895 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336895 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336895 RNA correlate with, and may be deduced from, the identity of the GAM336895 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336896 5746 AGCAGGATTA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAAGAGAAG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACAGGTTTT genes whose function and utility is known in the art.

GGGTTTTGCT GAM336896 is a novel bioinformatically detectable regulatory, non protein

GAAATTTGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336896 was detected

TGTCAGCATT is described with additional reference to Figs. 9-15.

GCATCACTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCCTTAACTG encoded by the human genome.

TT GAM336896 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336896 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336896 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336896 precursor RNA is designated SEQ ID:5746, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5746 is located from position 54032470 to position 54032561 relative to chromosome 15 on the `-` strand.

GAM336896 precursor RNA folds onto itself, forming GAM336896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336896 precursor RNA, designated SEQ ID NO: 5746, and a schematic representation of a predicted secondary folding of GAM336896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336896 folded precursor RNA yielding a GAM336896 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336896 RNA, hereby incorporated herein.

GAM336896 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336896 target RNA, herein designated GAM TARGET RNA.

GAM336896 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336896 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336896 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336896 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336896 RNA, herein designated GAM RNA, to target binding sites on GAM336896 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336896 target RNA into GAM336896 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336896 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336896 target genes. The mRNA of each one of this plurality of GAM336896 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336896 RNA, herein designated GAM RNA, and which when bound by GAM336896 RNA causes inhibition of translation of the GAM336896 target mRNA into a corresponding GAM336896 target protein.

The mechanism of the translational inhibition exerted by GAM336896 RNA, herein designated GAM RNA, on one or more GAM336896 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336896 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336896 RNA, herein designated GAM RNA, of GAM336896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336896 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336896 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336896 RNA correlate with, and may be deduced from, the identity of the GAM336896 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336897 6517 GCGGGCTAGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTCTCAGT detected oligonucleotides of the present invention, referred to here as Genomic Address

TGTTGGGTTT Messenger 336897 (GAM336897) oligonucleotides modulates expression of respective target
TCTTAGTGAA genes whose function and utility is known in the art.

ATAAGCAGCA GAM336897 is a novel bioinformatically detectable regulatory, non protein
ACAAACGACA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336897 was detected
ACAAAACCGC is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336897 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336897 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336897 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336897 precursor RNA is designated SEQ ID:6517, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6517 is located from position 54122958 to position 54123027 relative to chromosome 12 on the `-` strand.

GAM336897 precursor RNA folds onto itself, forming GAM336897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336897 precursor RNA, designated SEQ ID NO: 6517, and a schematic representation of a predicted secondary folding of GAM336897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336897 folded precursor RNA yielding a GAM336897 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336897 RNA, hereby incorporated herein.

GAM336897 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336897 target RNA, herein designated GAM TARGET RNA.

GAM336897 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336897 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336897 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336897 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336897 RNA, herein designated GAM RNA, to target binding sites on GAM336897 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336897 target RNA into GAM336897 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336897 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336897 target genes. The mRNA of each one of this plurality of GAM336897 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336897 RNA, herein designated GAM RNA, and which when bound by GAM336897 RNA causes inhibition of translation of the GAM336897 target mRNA into a corresponding GAM336897 target protein.

The mechanism of the translational inhibition exerted by GAM336897 RNA, herein designated GAM RNA, on one or more GAM336897 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336897 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336897 RNA, herein designated GAM RNA, of GAM336897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336897 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336897 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336897 RNA correlate with, and may be deduced from, the identity of the GAM336897 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336898 6653 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAGGCAGAGG Messenger 336898 (GAM336898) oligonucleotides modulates expression of respective target
TTGCGGTGAG genes whose function and utility is known in the art.

CCAAGATCGT GAM336898 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336898 was detected
TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAAACTCC encoded by the human genome.

GAM336898 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336898 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336898 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336898 precursor RNA is designated SEQ ID:6653, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6653 is located from position 54260659 to position 54260747 relative to chromosome 12 on the `-` strand.

GAM336898 precursor RNA folds onto itself, forming GAM336898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336898 precursor RNA, designated SEQ ID NO: 6653, and a schematic representation of a predicted secondary folding of GAM336898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336898 folded precursor RNA yielding a GAM336898 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336898 RNA, hereby incorporated herein.

GAM336898 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336898 target RNA, herein designated GAM TARGET RNA.

GAM336898 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336898 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336898 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336898 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336898 RNA, herein designated GAM RNA, to target binding sites on GAM336898 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336898 target RNA into GAM336898 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336898 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336898 target genes. The mRNA of each one of this plurality of GAM336898 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336898 RNA, herein designated GAM RNA, and which when bound by GAM336898 RNA causes inhibition of translation of the GAM336898 target mRNA into a corresponding GAM336898 target protein.

The mechanism of the translational inhibition exerted by GAM336898 RNA, herein designated GAM RNA, on one or more GAM336898 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336898 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336898 RNA, herein designated GAM RNA, of GAM336898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336898 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336898 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336898 RNA correlate with, and may be deduced from, the identity of the GAM336898 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336901 5870 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336901 (GAM336901) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336901 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336901 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336901 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336901 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336901 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336901 precursor RNA is designated SEQ ID:5870, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5870 is located from position 55006289 to position 55006370 relative to chromosome 16 on the `+` strand.

GAM336901 precursor RNA folds onto itself, forming GAM336901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336901 precursor RNA, designated SEQ ID NO: 5870, and a schematic representation of a predicted secondary folding of GAM336901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336901 folded precursor

RNA yielding a GAM336901 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336901 RNA, hereby incorporated herein.

GAM336901 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336901 target RNA, herein designated GAM TARGET RNA.

GAM336901 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336901 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336901 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336901 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336901 RNA, herein designated GAM RNA, to target binding sites on GAM336901 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336901 target RNA into GAM336901 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336901 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336901 target genes. The mRNA of each one of this plurality of GAM336901 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336901 RNA, herein designated GAM RNA, and which when bound by GAM336901 RNA causes inhibition of translation of the GAM336901 target mRNA into a corresponding GAM336901 target protein.

The mechanism of the translational inhibition exerted by GAM336901 RNA, herein designated GAM RNA, on one or more GAM336901 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336901 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336901 RNA, herein designated GAM RNA, of GAM336901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336901 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336901 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336901 RNA correlate with, and may be deduced from, the identity of the GAM336901 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336903 (GAM336903) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336903 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336903 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336903 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336903 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336903 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336903 precursor RNA is designated SEQ ID:7102, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7102 is located from position 55618701 to position 55618802 relative to chromosome 20 on the `+` strand.

GAM336903 precursor RNA folds onto itself, forming GAM336903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of

the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336903 precursor RNA, designated SEQ ID NO: 7102, and a schematic representation of a predicted secondary folding of GAM336903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336903 folded precursor RNA yielding a GAM336903 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336903 RNA, hereby incorporated herein.

GAM336903 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336903 target RNA, herein designated GAM TARGET RNA.

GAM336903 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336903 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336903 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336903 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336903 RNA, herein designated GAM RNA, to target binding sites on GAM336903 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336903 target RNA into GAM336903 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336903 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336903 target genes. The mRNA of each one of this plurality of GAM336903 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336903 RNA, herein designated GAM RNA, and which when bound by GAM336903 RNA causes inhibition of translation of the GAM336903 target mRNA into a corresponding GAM336903 target protein.

The mechanism of the translational inhibition exerted by GAM336903 RNA, herein designated GAM RNA, on one or more GAM336903 target genes, herein collectively designated

GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336903 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336903 RNA, herein designated GAM RNA, of GAM336903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336903 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336903 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336903 RNA correlate with, and may be deduced from, the identity of the GAM336903 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336906 7132 TGAGGCAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCACTTG detected oligonucleotides of the present invention, referred to here as Genomic Address

AACCCGGGAG Messenger 336906 (GAM336906) oligonucleotides modulates expression of respective target

GTGGAGCTTG genes whose function and utility is known in the art.

CGGTGAGCCG GAM336906 is a novel bioinformatically detectable regulatory, non protein

AGATCGCGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336906 was detected

ATTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACAAGAGTGA encoded by the human genome.

AACTCCATCT GAM336906 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CA GAM336906 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336906 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336906 precursor RNA is designated SEQ ID:7132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7132 is located from position 56423119 to position 56423220

relative to chromosome 12 on the `-` strand.

GAM336906 precursor RNA folds onto itself, forming GAM336906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336906 precursor RNA, designated SEQ ID NO: 7132, and a schematic representation of a predicted secondary folding of GAM336906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336906 folded precursor RNA yielding a GAM336906 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336906 RNA, hereby incorporated herein. Expression of GAM336906 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336906 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336906 target RNA, herein designated GAM TARGET RNA.

GAM336906 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336906 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336906 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336906 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336906 RNA, herein designated GAM RNA, to target binding sites on GAM336906 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336906 target RNA into GAM336906 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336906 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336906 target genes. The mRNA of each one of this plurality of GAM336906 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336906 RNA, herein designated GAM RNA, and which when bound by GAM336906 RNA causes inhibition of translation of the GAM336906 target mRNA into a corresponding GAM336906 target protein.

The mechanism of the translational inhibition exerted by GAM336906 RNA, herein designated GAM RNA, on one or more GAM336906 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336906 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336906 RNA, herein designated GAM RNA, of GAM336906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336906 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336906 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336906 RNA correlate with, and may be deduced from, the identity of the GAM336906 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336907 6613 GGAGAATCAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGAACCCGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GAGGTGGAGC Messenger 336907 (GAM336907) oligonucleotides modulates expression of respective target

TTGCGGTGAG genes whose function and utility is known in the art.

CCGAGATCGC GAM336907 is a novel bioinformatically detectable regulatory, non protein

GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336907 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAAACTCC encoded by the human genome.

GAM336907 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336907 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336907 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336907 precursor RNA is designated SEQ ID:6613, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6613 is located from position 56423125 to position 56423213 relative to chromosome 12 on the `-` strand.

GAM336907 precursor RNA folds onto itself, forming GAM336907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336907 precursor RNA, designated SEQ ID NO: 6613, and a schematic representation of a predicted secondary folding of GAM336907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336907 folded precursor RNA yielding a GAM336907 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336907 RNA, hereby incorporated herein. Expression of GAM336907 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336907 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336907 target RNA, herein designated GAM TARGET RNA.

GAM336907 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336907 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336907 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336907 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336907 RNA, herein designated GAM RNA, to target binding sites on GAM336907 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336907 target RNA into GAM336907 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336907 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336907 target genes. The mRNA of each one of this plurality of GAM336907 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336907 RNA, herein designated GAM RNA, and which when bound by GAM336907 RNA causes inhibition of translation of the GAM336907 target mRNA into a corresponding GAM336907 target protein.

The mechanism of the translational inhibition exerted by GAM336907 RNA, herein designated GAM RNA, on one or more GAM336907 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336907 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336907 RNA, herein designated GAM RNA, of GAM336907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336907 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336907 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336907 RNA correlate with, and may be deduced from, the identity of the GAM336907 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336908 5871 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336908 (GAM336908) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336908 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336908 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336908 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336908 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336908 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336908 precursor RNA is designated SEQ ID:5871, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5871 is located from position 56590496 to position 56590577 relative to chromosome 2 on the `-` strand.

GAM336908 precursor RNA folds onto itself, forming GAM336908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336908 precursor RNA, designated SEQ ID NO: 5871, and a schematic representation of a predicted secondary folding of GAM336908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336908 folded precursor RNA yielding a GAM336908 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336908 RNA, hereby incorporated herein.

GAM336908 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336908 target RNA, herein designated GAM TARGET RNA.

GAM336908 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336908 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336908 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336908 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336908 RNA, herein designated GAM RNA, to target binding sites on GAM336908 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336908 target RNA into GAM336908 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336908 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336908 target genes. The mRNA of each one of this plurality of GAM336908 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336908 RNA, herein designated GAM RNA, and which when bound by GAM336908 RNA causes inhibition of translation of the GAM336908 target mRNA into a corresponding GAM336908 target protein.

The mechanism of the translational inhibition exerted by GAM336908 RNA, herein designated GAM RNA, on one or more GAM336908 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336908 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336908 RNA, herein designated GAM RNA, of GAM336908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336908 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336908 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336908 RNA correlate with, and may be deduced from, the identity of the GAM336908 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336909 6715 GGAGGTGGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
TGTGTGTGCT detected oligonucleotides of the present invention, referred to here as Genomic Address
ACTGGCATCT Messenger 336909 (GAM336909) oligonucleotides modulates expression of respective target
AGTGGCTGCT genes whose function and utility is known in the art.

AAACATCCTA GAM336909 is a novel bioinformatically detectable regulatory, non protein
CACTGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336909 was detected
is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336909 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336909 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336909 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336909 precursor RNA is designated SEQ ID:6715, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6715 is located from position 56700933 to position 56700988 relative to chromosome 12 on the `+` strand.

GAM336909 precursor RNA folds onto itself, forming GAM336909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336909 precursor RNA, designated SEQ ID NO: 6715, and a schematic representation of a predicted secondary folding of GAM336909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336909 folded precursor RNA yielding a GAM336909 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336909 RNA, hereby incorporated herein.

GAM336909 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336909 target RNA, herein designated GAM TARGET RNA.

GAM336909 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336909 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336909 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336909 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336909 RNA, herein designated GAM RNA, to target binding sites on GAM336909 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336909 target RNA into GAM336909 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336909 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336909 target genes. The mRNA of each one of this plurality of GAM336909 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336909 RNA, herein designated GAM RNA, and which when bound by GAM336909 RNA causes inhibition of translation of the GAM336909 target mRNA into a corresponding GAM336909 target protein.

The mechanism of the translational inhibition exerted by GAM336909 RNA, herein designated GAM RNA, on one or more GAM336909 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336909 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336909 RNA, herein designated GAM RNA, of GAM336909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336909 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336909 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336909 RNA correlate with, and may be deduced from, the identity of the GAM336909 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336911 6930 GTGTTAGAGA Fig. 8 further provides a conceptual description of another novel bioinformatically
CCAGTTAAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TTAAGACACT Messenger 336911 (GAM336911) oligonucleotides modulates expression of respective target
TTCTAAATAG genes whose function and utility is known in the art.

AAGTCTTGTA GAM336911 is a novel bioinformatically detectable regulatory, non protein
TATGGGGCTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336911 was detected
TTGAGAAAGT is described with additional reference to Figs. 9-15.

GTTTTCCCGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATGCTGGGG encoded by the human genome.

GGAAACAC GAM336911 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336911 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336911 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336911 precursor RNA is designated SEQ ID:6930, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6930 is located from position 56703572 to position 56703669 relative to chromosome 16 on the `+` strand.

GAM336911 precursor RNA folds onto itself, forming GAM336911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336911 precursor RNA, designated SEQ ID NO: 6930, and a schematic representation of a predicted secondary folding of GAM336911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336911 folded precursor RNA yielding a GAM336911 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336911 RNA, hereby incorporated herein.

GAM336911 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336911 target RNA, herein designated GAM TARGET RNA.

GAM336911 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336911 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336911 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336911 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336911 RNA, herein designated GAM RNA, to target binding sites on GAM336911 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336911 target RNA into GAM336911 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336911 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336911 target genes. The mRNA of each one of this plurality of GAM336911 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336911 RNA, herein designated GAM RNA, and which when bound by GAM336911 RNA causes inhibition of translation of the GAM336911 target mRNA into a corresponding GAM336911 target protein.

The mechanism of the translational inhibition exerted by GAM336911 RNA, herein designated GAM RNA, on one or more GAM336911 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336911 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336911 RNA, herein designated GAM RNA, of

GAM336911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336911 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336911 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336911 RNA correlate with, and may be deduced from, the identity of the GAM336911 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336913 5697 ACCTCATCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

TACAAAAAAT detected oligonucleotides of the present invention, referred to here as Genomic Address

ACGAAAATTA Messenger 336913 (GAM336913) oligonucleotides modulates expression of respective target

GCTGGGTGTG genes whose function and utility is known in the art.

GTGGCATGTA GAM336913 is a novel bioinformatically detectable regulatory, non protein

CCTGTAGTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336913 was detected

CAGCTATTTG is described with additional reference to Figs. 9-15.

AGAGACTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GT encoded by the human genome.

GAM336913 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336913 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336913 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336913 precursor RNA is designated SEQ ID:5697, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5697 is located from position 56716065 to position 56716146 relative to chromosome 12 on the `-` strand.

GAM336913 precursor RNA folds onto itself, forming GAM336913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336913 precursor RNA, designated SEQ ID NO: 5697, and

a schematic representation of a predicted secondary folding of GAM336913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336913 folded precursor RNA yielding a GAM336913 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336913 RNA, hereby incorporated herein.

GAM336913 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336913 target RNA, herein designated GAM TARGET RNA.

GAM336913 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336913 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336913 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336913 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336913 RNA, herein designated GAM RNA, to target binding sites on GAM336913 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336913 target RNA into GAM336913 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336913 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336913 target genes. The mRNA of each one of this plurality of GAM336913 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336913 RNA, herein designated GAM RNA, and which when bound by GAM336913 RNA causes inhibition of translation of the GAM336913 target mRNA into a corresponding GAM336913 target protein.

The mechanism of the translational inhibition exerted by GAM336913 RNA, herein designated GAM RNA, on one or more GAM336913 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336913 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336913 RNA, herein designated GAM RNA, of GAM336913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336913 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336913 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336913 RNA correlate with, and may be deduced from, the identity of the GAM336913 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336914 6110 CCTCATCTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

ACAAAAAATA detected oligonucleotides of the present invention, referred to here as Genomic Address

CGAAAATTAG Messenger 336914 (GAM336914) oligonucleotides modulates expression of respective target

CTGGGTGTGG genes whose function and utility is known in the art.

TGGCATGTAC GAM336914 is a novel bioinformatically detectable regulatory, non protein

CTGTAGTCCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336914 was detected

AGCTATTTGA is described with additional reference to Figs. 9-15.

GAGACTGAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336914 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336914 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336914 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336914 precursor RNA is designated SEQ ID:6110, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6110 is located from position 56716066 to position 56716145 relative to chromosome 12 on the `-` strand.

GAM336914 precursor RNA folds onto itself, forming GAM336914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336914 precursor RNA, designated SEQ ID NO: 6110, and a schematic representation of a predicted secondary folding of GAM336914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336914 folded precursor RNA yielding a GAM336914 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336914 RNA, hereby incorporated herein.

GAM336914 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336914 target RNA, herein designated GAM TARGET RNA.

GAM336914 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336914 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336914 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336914 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336914 RNA, herein designated GAM RNA, to target binding sites on GAM336914 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336914 target RNA into GAM336914 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336914 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336914 target genes. The mRNA of each one of this plurality of GAM336914 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336914 RNA, herein designated GAM RNA, and which when bound by GAM336914 RNA causes inhibition of translation of the GAM336914 target mRNA into a corresponding GAM336914 target protein.

The mechanism of the translational inhibition exerted by GAM336914 RNA, herein designated GAM RNA, on one or more GAM336914 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336914 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336914 RNA, herein designated GAM RNA, of GAM336914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336914 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336914 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336914 RNA correlate with, and may be deduced from, the identity of the GAM336914 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336916 6302 GAATAGCGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTGCCCAAGC detected oligonucleotides of the present invention, referred to here as Genomic Address

TCACAAAGTA Messenger 336916 (GAM336916) oligonucleotides modulates expression of respective target

TGTGATGGAG genes whose function and utility is known in the art.

CTAGAGATTC GAM336916 is a novel bioinformatically detectable regulatory, non protein

AAACCCAGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336916 was detected

CTCTCTGGCT is described with additional reference to Figs. 9-15.

CCTTCTTTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGTGGGCTTG encoded by the human genome.

CTCTGGGAAA GAM336916 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

ATATGCTATT GAM336916 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

T GAM336916 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336916 precursor RNA is designated SEQ ID:6302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6302 is located from position 56865886 to position 56865996 relative to chromosome 19 on the `-` strand.

GAM336916 precursor RNA folds onto itself, forming GAM336916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336916 precursor RNA, designated SEQ ID NO: 6302, and a schematic representation of a predicted secondary folding of GAM336916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336916 folded precursor RNA yielding a GAM336916 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336916 RNA, hereby incorporated herein.

GAM336916 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336916 target RNA, herein designated GAM TARGET RNA.

GAM336916 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336916 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336916 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336916 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336916 RNA, herein designated GAM RNA, to target binding sites on GAM336916 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336916 target RNA into GAM336916 target protein, herein designated GAM TARGET PROTEIN,, which is shown

surrounded by a broken line.

It is appreciated that GAM336916 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336916 target genes. The mRNA of each one of this plurality of GAM336916 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336916 RNA, herein designated GAM RNA, and which when bound by GAM336916 RNA causes inhibition of translation of the GAM336916 target mRNA into a corresponding GAM336916 target protein.

The mechanism of the translational inhibition exerted by GAM336916 RNA, herein designated GAM RNA, on one or more GAM336916 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336916 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336916 RNA, herein designated GAM RNA, of GAM336916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336916 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336916 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336916 RNA correlate with, and may be deduced from, the identity of the GAM336916 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336917 6133 CCTTTGCTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

GGCCTTTAAC detected oligonucleotides of the present invention, referred to here as Genomic Address

AACTCAGTGT Messenger 336917 (GAM336917) oligonucleotides modulates expression of respective target

TTTGGTCTAA genes whose function and utility is known in the art.

TCTTCAAGAG GAM336917 is a novel bioinformatically detectable regulatory, non protein

GAATTTGAGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336917 was detected

TTCACTTGAA is described with additional reference to Figs. 9-15.

TAAGTTAGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TAGTTTGAGG encoded by the human genome.

TGGGTGTAGC GAM336917 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TAGAGG GAM336917 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336917 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336917 precursor RNA is designated SEQ ID:6133, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6133 is located from position 56876889 to position 56876994 relative to chromosome 15 on the `+` strand.

GAM336917 precursor RNA folds onto itself, forming GAM336917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336917 precursor RNA, designated SEQ ID NO: 6133, and a schematic representation of a predicted secondary folding of GAM336917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336917 folded precursor RNA yielding a GAM336917 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336917 RNA, hereby incorporated herein.

GAM336917 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336917 target RNA, herein designated GAM TARGET RNA.

GAM336917 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336917 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336917 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336917 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region

or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336917 RNA, herein designated GAM RNA, to target binding sites on GAM336917 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336917 target RNA into GAM336917 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336917 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336917 target genes. The mRNA of each one of this plurality of GAM336917 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336917 RNA, herein designated GAM RNA, and which when bound by GAM336917 RNA causes inhibition of translation of the GAM336917 target mRNA into a corresponding GAM336917 target protein.

The mechanism of the translational inhibition exerted by GAM336917 RNA, herein designated GAM RNA, on one or more GAM336917 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336917 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336917 RNA, herein designated GAM RNA, of GAM336917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336917 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336917 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336917 RNA correlate with, and may be deduced from, the identity of the GAM336917 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336918 6570 GCTTTGGCCT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTAACAACTC detected oligonucleotides of the present invention, referred to here as Genomic Address

AGTGTTTTGG Messenger 336918 (GAM336918) oligonucleotides modulates expression of respective target

TCTAATCTTC genes whose function and utility is known in the art.

AAGAGGAATT GAM336918 is a novel bioinformatically detectable regulatory, non protein
TGAGGTTCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336918 was detected
TTGAATAAGT is described with additional reference to Figs. 9-15.

TAGACTAGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGAGGTGGGT encoded by the human genome.

GTAGCTAGAG GAM336918 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GATTGAAGT GAM336918 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336918 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336918 precursor RNA is designated SEQ ID:6570, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6570 is located from position 56876894 to position 56877002 relative to chromosome 15 on the `+` strand.

GAM336918 precursor RNA folds onto itself, forming GAM336918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336918 precursor RNA, designated SEQ ID NO: 6570, and a schematic representation of a predicted secondary folding of GAM336918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336918 folded precursor RNA yielding a GAM336918 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336918 RNA, hereby incorporated herein.

GAM336918 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336918 target RNA, herein designated GAM TARGET RNA.

GAM336918 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336918 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336918 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336918 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336918 RNA, herein designated GAM RNA, to target binding sites on GAM336918 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336918 target RNA into GAM336918 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336918 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336918 target genes. The mRNA of each one of this plurality of GAM336918 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336918 RNA, herein designated GAM RNA, and which when bound by GAM336918 RNA causes inhibition of translation of the GAM336918 target mRNA into a corresponding GAM336918 target protein.

The mechanism of the translational inhibition exerted by GAM336918 RNA, herein designated GAM RNA, on one or more GAM336918 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336918 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336918 RNA, herein designated GAM RNA, of GAM336918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336918 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336918 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336918 RNA correlate with, and may be deduced from, the identity of the GAM336918 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336919 5872 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336919 (GAM336919) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336919 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336919 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336919 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336919 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336919 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336919 precursor RNA is designated SEQ ID:5872, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5872 is located from position 56896949 to position 56897030 relative to chromosome 5 on the `+` strand.

GAM336919 precursor RNA folds onto itself, forming GAM336919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336919 precursor RNA, designated SEQ ID NO: 5872, and a schematic representation of a predicted secondary folding of GAM336919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336919 folded precursor RNA yielding a GAM336919 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336919 RNA, hereby incorporated herein.

GAM336919 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336919 target RNA, herein designated GAM TARGET RNA.

GAM336919 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336919 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336919 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336919 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336919 RNA, herein designated GAM RNA, to target binding sites on GAM336919 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336919 target RNA into GAM336919 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336919 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336919 target genes. The mRNA of each one of this plurality of GAM336919 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336919 RNA, herein designated GAM RNA, and which when bound by GAM336919 RNA causes inhibition of translation of the GAM336919 target mRNA into a corresponding GAM336919 target protein.

The mechanism of the translational inhibition exerted by GAM336919 RNA, herein designated GAM RNA, on one or more GAM336919 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336919 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336919 RNA, herein designated GAM RNA, of GAM336919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336919 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336919 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336919 RNA correlate with, and may be deduced from, the identity of the GAM336919 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336920 7247 TGGGTGCCTG Fig. 8 further provides a conceptual description of another novel bioinformatically
TAATCCCAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TACTTGGGAG Messenger 336920 (GAM336920) oligonucleotides modulates expression of respective target
GTTGAGGCAG genes whose function and utility is known in the art.

GAGAATCACT GAM336920 is a novel bioinformatically detectable regulatory, non protein
TGAACCCAGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336920 was detected
AGGTGGAGGT is described with additional reference to Figs. 9-15.

TGCAGTGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CCA encoded by the human genome.

GAM336920 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336920 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336920 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336920 precursor RNA is designated SEQ ID:7247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7247 is located from position 56913348 to position 56913430 relative to chromosome 16 on the `+` strand.

GAM336920 precursor RNA folds onto itself, forming GAM336920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336920 precursor RNA, designated SEQ ID NO: 7247, and a schematic representation of a predicted secondary folding of GAM336920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336920 folded precursor RNA yielding a GAM336920 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336920 RNA, hereby incorporated herein.

GAM336920 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336920 target RNA, herein designated GAM TARGET RNA.

GAM336920 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336920 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336920 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336920 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336920 RNA, herein designated GAM RNA, to target binding sites on GAM336920 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336920 target RNA into GAM336920 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336920 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336920 target genes. The mRNA of each one of this plurality of GAM336920 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336920 RNA, herein designated GAM RNA, and which when bound by GAM336920 RNA causes inhibition of translation of the GAM336920 target mRNA into a corresponding GAM336920 target protein.

The mechanism of the translational inhibition exerted by GAM336920 RNA, herein designated GAM RNA, on one or more GAM336920 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336920 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336920 RNA, herein designated GAM RNA, of GAM336920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336920 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336920 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336920 RNA correlate with, and may be deduced from, the identity of the GAM336920 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336921 7105 TGAGATGGGA Fig. 8 further provides a conceptual description of another novel bioinformatically
GGACTGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AGCCCAGGAG Messenger 336921 (GAM336921) oligonucleotides modulates expression of respective target
GTTGAGGTTG genes whose function and utility is known in the art.

CAGTGAACCA GAM336921 is a novel bioinformatically detectable regulatory, non protein
TGATCATGTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336921 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGTA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAGAGTGAG encoded by the human genome.

ACCTTGTTTC GAM336921 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

A GAM336921 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336921 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336921 precursor RNA is designated SEQ ID:7105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7105 is located from position 57181803 to position 57181903 relative to chromosome 17 on the `+` strand.

GAM336921 precursor RNA folds onto itself, forming GAM336921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336921 precursor RNA, designated SEQ ID NO: 7105, and a schematic representation of a predicted secondary folding of GAM336921 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336921 folded precursor RNA yielding a GAM336921 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336921 RNA, hereby incorporated herein.

GAM336921 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336921 target RNA, herein designated GAM TARGET RNA.

GAM336921 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336921 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336921 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336921 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336921 RNA, herein designated GAM RNA, to target binding sites on GAM336921 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336921 target RNA into GAM336921 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336921 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336921 target genes. The mRNA of each one of this plurality of GAM336921 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336921 RNA, herein designated GAM RNA, and which when bound by GAM336921 RNA causes inhibition of translation of the GAM336921 target mRNA into a corresponding GAM336921 target protein.

The mechanism of the translational inhibition exerted by GAM336921 RNA, herein designated GAM RNA, on one or more GAM336921 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336921 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336921 RNA, herein designated GAM RNA, of GAM336921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336921 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336921 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336921 RNA correlate with, and may be deduced from, the identity of the GAM336921 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336922 6599 GGACTGCTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AGCCCAGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GTTGAGGTTG Messenger 336922 (GAM336922) oligonucleotides modulates expression of respective target

CAGTGAACCA genes whose function and utility is known in the art.

TGATCATGTC GAM336922 is a novel bioinformatically detectable regulatory, non protein

ACTGCACTCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336922 was detected

AGCCTGGGTA is described with additional reference to Figs. 9-15.

ACAGAGTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ACC encoded by the human genome.

GAM336922 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336922 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336922 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336922 precursor RNA is designated SEQ ID:6599, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6599 is located from position 57181813 to position 57181895 relative to chromosome 17 on the `+` strand.

GAM336922 precursor RNA folds onto itself, forming GAM336922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336922 precursor RNA, designated SEQ ID NO: 6599, and a schematic representation of a predicted secondary folding of GAM336922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336922 folded precursor RNA yielding a GAM336922 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336922 RNA, hereby incorporated herein.

GAM336922 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336922 target RNA, herein designated GAM TARGET RNA.

GAM336922 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336922 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336922 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336922 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336922 RNA, herein designated GAM RNA, to target binding sites on GAM336922 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336922 target RNA into GAM336922 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336922 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336922 target genes. The mRNA of each one of this plurality of GAM336922 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336922 RNA, herein designated GAM RNA, and which when bound by GAM336922 RNA causes inhibition of translation of the GAM336922 target mRNA into a corresponding GAM336922 target protein.

The mechanism of the translational inhibition exerted by GAM336922 RNA, herein designated GAM RNA, on one or more GAM336922 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336922 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336922 RNA, herein designated GAM RNA, of GAM336922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336922 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336922 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336922 RNA correlate with, and may be deduced from, the identity of the GAM336922 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336923 6458 GAGGTGGGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GGTCACTTGA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCCCAGAATT Messenger 336923 (GAM336923) oligonucleotides modulates expression of respective target

TCAAGGCTGC genes whose function and utility is known in the art.

AGTGAGCTAT GAM336923 is a novel bioinformatically detectable regulatory, non protein

GATTAAGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336923 was detected

CTGCACTCCA is described with additional reference to Figs. 9-15.

GCCTGGGCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGAGTGAGA encoded by the human genome.

CCTCCAACTT GAM336923 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

T GAM336923 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336923 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM336923 precursor RNA is designated SEQ ID:6458, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6458 is located from position 57192272 to position 57192372 relative to chromosome 4 on the `+` strand.

GAM336923 precursor RNA folds onto itself, forming GAM336923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336923 precursor RNA, designated SEQ ID NO: 6458, and a schematic representation of a predicted secondary folding of GAM336923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336923 folded precursor RNA yielding a GAM336923 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336923 RNA, hereby incorporated herein. Expression of GAM336923 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336923 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336923 target RNA, herein designated GAM TARGET RNA.

GAM336923 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336923 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336923 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336923 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336923 RNA, herein designated GAM RNA, to target binding sites on GAM336923 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336923 target RNA into GAM336923 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336923 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336923 target genes. The mRNA of each one of this plurality of GAM336923 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336923 RNA, herein designated GAM RNA, and which when bound by GAM336923 RNA causes inhibition of translation of the GAM336923 target mRNA into a corresponding GAM336923 target protein.

The mechanism of the translational inhibition exerted by GAM336923 RNA, herein designated GAM RNA, on one or more GAM336923 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336923 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336923 RNA, herein designated GAM RNA, of GAM336923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336923 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336923 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336923 RNA correlate with, and may be deduced from, the identity of the GAM336923 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336924 5873 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336924 (GAM336924) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336924 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336924 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336924 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336924 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336924 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336924 precursor RNA is designated SEQ ID:5873, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5873 is located from position 57442342 to position 57442423 relative to chromosome 8 on the `+` strand.

GAM336924 precursor RNA folds onto itself, forming GAM336924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336924 precursor RNA, designated SEQ ID NO: 5873, and a schematic representation of a predicted secondary folding of GAM336924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336924 folded precursor RNA yielding a GAM336924 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336924 RNA, hereby incorporated herein.

GAM336924 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336924 target RNA, herein designated GAM TARGET RNA.

GAM336924 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336924 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336924 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336924 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336924 RNA, herein designated GAM RNA, to target binding sites on GAM336924 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336924 target RNA into GAM336924 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336924 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336924 target genes. The mRNA of each one of this plurality of GAM336924 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336924 RNA, herein designated GAM RNA, and which when bound by GAM336924 RNA causes inhibition of translation of the GAM336924 target mRNA into a corresponding GAM336924 target protein.

The mechanism of the translational inhibition exerted by GAM336924 RNA, herein designated GAM RNA, on one or more GAM336924 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336924 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336924 RNA, herein designated GAM RNA, of GAM336924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336924 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336924 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336924 RNA correlate with, and may be deduced from, the identity of the GAM336924 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336925 6784 GGGAGACTTG Fig. 8 further provides a conceptual description of another novel bioinformatically

CTTGAACCCA detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAGGCGGAG Messenger 336925 (GAM336925) oligonucleotides modulates expression of respective target

GGTGCAGTGA genes whose function and utility is known in the art.

GTCGACATCA GAM336925 is a novel bioinformatically detectable regulatory, non protein
TGCCACTGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336925 was detected
CTCCAGCCTG is described with additional reference to Figs. 9-15.

GGCAACAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAAGACCC encoded by the human genome.

GAM336925 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336925 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336925 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336925 precursor RNA is designated SEQ ID:6784, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6784 is located from position 57533860 to position 57533947 relative to chromosome 12 on the `+` strand.

GAM336925 precursor RNA folds onto itself, forming GAM336925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336925 precursor RNA, designated SEQ ID NO: 6784, and a schematic representation of a predicted secondary folding of GAM336925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336925 folded precursor RNA yielding a GAM336925 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336925 RNA, hereby incorporated herein. Expression of GAM336925 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336925 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336925 target RNA, herein designated GAM TARGET RNA.

GAM336925 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336925 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336925 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336925 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336925 RNA, herein designated GAM RNA, to target binding sites on GAM336925 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336925 target RNA into GAM336925 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336925 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336925 target genes. The mRNA of each one of this plurality of GAM336925 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336925 RNA, herein designated GAM RNA, and which when bound by GAM336925 RNA causes inhibition of translation of the GAM336925 target mRNA into a corresponding GAM336925 target protein.

The mechanism of the translational inhibition exerted by GAM336925 RNA, herein designated GAM RNA, on one or more GAM336925 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336925 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336925 RNA, herein designated GAM RNA, of GAM336925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336925 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336925 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336925 RNA correlate with, and may be deduced from, the identity of the GAM336925 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336926 6268 CTTGCTTGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
CCCAGGAGGC detected oligonucleotides of the present invention, referred to here as Genomic Address
GGAGGGTGCA Messenger 336926 (GAM336926) oligonucleotides modulates expression of respective target
GTGAGTCGAC genes whose function and utility is known in the art.

ATCATGCCAC GAM336926 is a novel bioinformatically detectable regulatory, non protein
TGCACTCCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336926 was detected
CCTGGGCAAC is described with additional reference to Figs. 9-15.

AGAGCAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336926 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336926 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336926 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336926 precursor RNA is designated SEQ ID:6268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6268 is located from position 57533866 to position 57533943 relative to chromosome 12 on the `+` strand.

GAM336926 precursor RNA folds onto itself, forming GAM336926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336926 precursor RNA, designated SEQ ID NO: 6268, and a schematic representation of a predicted secondary folding of GAM336926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336926 folded precursor RNA yielding a GAM336926 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336926 RNA, hereby incorporated herein. Expression of GAM336926 RNA was experimentally validated in HeLa cells using the methods

described with reference to Figs.22 to 24.

GAM336926 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336926 target RNA, herein designated GAM TARGET RNA.

GAM336926 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336926 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336926 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336926 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336926 RNA, herein designated GAM RNA, to target binding sites on GAM336926 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336926 target RNA into GAM336926 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336926 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336926 target genes. The mRNA of each one of this plurality of GAM336926 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336926 RNA, herein designated GAM RNA, and which when bound by GAM336926 RNA causes inhibition of translation of the GAM336926 target mRNA into a corresponding GAM336926 target protein.

The mechanism of the translational inhibition exerted by GAM336926 RNA, herein designated GAM RNA, on one or more GAM336926 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336926 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336926 RNA, herein designated GAM RNA, of GAM336926 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336926 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336926 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336926 RNA correlate with, and may be deduced from, the identity of the GAM336926 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336927 7300 TTCCATTTTC Fig. 8 further provides a conceptual description of another novel bioinformatically
TCATTGCCTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AAGATCTCTG Messenger 336927 (GAM336927) oligonucleotides modulates expression of respective target
CTGATGCTCC genes whose function and utility is known in the art.

TGGAGAATGA GAM336927 is a novel bioinformatically detectable regulatory, non protein
CTTTGGGGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336927 was detected
TTTAGAAAGA is described with additional reference to Figs. 9-15.

ATATTGCCAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCCGTCTCGG encoded by the human genome.

CAAGGAGATG GAM336927 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
ATGGGA GAM336927 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336927 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336927 precursor RNA is designated SEQ ID:7300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7300 is located from position 57662274 to position 57662379 relative to chromosome 20 on the `+` strand.

GAM336927 precursor RNA folds onto itself, forming GAM336927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336927 precursor RNA, designated SEQ ID NO: 7300, and a schematic representation of a predicted secondary folding of GAM336927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336927 folded precursor RNA yielding a GAM336927 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336927 RNA, hereby incorporated herein.

GAM336927 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336927 target RNA, herein designated GAM TARGET RNA.

GAM336927 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336927 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336927 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336927 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336927 RNA, herein designated GAM RNA, to target binding sites on GAM336927 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336927 target RNA into GAM336927 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336927 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336927 target genes. The mRNA of each one of this plurality of GAM336927 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336927 RNA, herein designated GAM RNA, and which when bound by GAM336927 RNA causes inhibition of translation of the GAM336927 target mRNA into a corresponding GAM336927 target protein.

The mechanism of the translational inhibition exerted by GAM336927 RNA, herein designated GAM RNA, on one or more GAM336927 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336927 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336927 RNA, herein designated GAM RNA, of GAM336927 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336927 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336927 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336927 RNA correlate with, and may be deduced from, the identity of the GAM336927 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336931 6649 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGCGGAGG Messenger 336931 (GAM336931) oligonucleotides modulates expression of respective target

TGGTGGTGAG genes whose function and utility is known in the art.

CCGAGATTGT GAM336931 is a novel bioinformatically detectable regulatory, non protein

GCCACTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336931 was detected

TCCAGCCTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAAAAACTCC encoded by the human genome.

GAM336931 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336931 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336931 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336931 precursor RNA is designated SEQ ID:6649, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6649 is located from position 57796024 to position 57796113 relative to chromosome 19 on the `+` strand.

GAM336931 precursor RNA folds onto itself, forming GAM336931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336931 precursor RNA, designated SEQ ID NO: 6649, and a schematic representation of a predicted secondary folding of GAM336931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336931 folded precursor RNA yielding a GAM336931 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336931 RNA, hereby incorporated herein. Expression of GAM336931 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336931 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336931 target RNA, herein designated GAM TARGET RNA.

GAM336931 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336931 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336931 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336931 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336931 RNA, herein designated GAM RNA, to target binding sites on GAM336931 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336931 target RNA into GAM336931 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336931 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336931 target genes. The mRNA of each one of this plurality of GAM336931 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336931 RNA, herein designated GAM RNA, and which when bound by GAM336931 RNA causes inhibition of

translation of the GAM336931 target mRNA into a corresponding GAM336931 target protein.

The mechanism of the translational inhibition exerted by GAM336931 RNA, herein designated GAM RNA, on one or more GAM336931 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336931 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336931 RNA, herein designated GAM RNA, of GAM336931 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336931 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336931 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336931 RNA correlate with, and may be deduced from, the identity of the GAM336931 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

ACAGGCTGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GATACTCCCA encoded by the human genome.

GCAATCTGAA GAM336932 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GCCGGAGAGA GAM336932 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

G GAM336932 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336932 precursor RNA is designated SEQ ID:6175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6175 is located from position 58065317 to position 58065427 relative to chromosome 14 on the `+` strand.

GAM336932 precursor RNA folds onto itself, forming GAM336932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336932 precursor RNA, designated SEQ ID NO: 6175, and a schematic representation of a predicted secondary folding of GAM336932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336932 folded precursor RNA yielding a GAM336932 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336932 RNA, hereby incorporated herein.

GAM336932 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336932 target RNA, herein designated GAM TARGET RNA.

GAM336932 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336932 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336932 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336932 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336932 RNA, herein designated GAM RNA, to target binding sites on GAM336932 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336932 target RNA

into GAM336932 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336932 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336932 target genes. The mRNA of each one of this plurality of GAM336932 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336932 RNA, herein designated GAM RNA, and which when bound by GAM336932 RNA causes inhibition of translation of the GAM336932 target mRNA into a corresponding GAM336932 target protein.

The mechanism of the translational inhibition exerted by GAM336932 RNA, herein designated GAM RNA, on one or more GAM336932 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336932 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336932 RNA, herein designated GAM RNA, of GAM336932 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336932 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336932 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336932 RNA correlate with, and may be deduced from, the identity of the GAM336932 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336933 6290 GAAGAACTGG Fig. 8 further provides a conceptual description of another novel bioinformatically

GTGATCTTGT detected oligonucleotides of the present invention, referred to here as Genomic Address

GAAATCTGTG Messenger 336933 (GAM336933) oligonucleotides modulates expression of respective target

GACCCTACAT genes whose function and utility is known in the art.

TGGCACTTAG GAM336933 is a novel bioinformatically detectable regulatory, non protein

TGTGTACCTA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336933 was detected

AGGGCTAACG is described with additional reference to Figs. 9-15.

TCCCAAATAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

AGTCATTCAG encoded by the human genome.

TGCTTT GAM336933 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336933 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336933 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336933 precursor RNA is designated SEQ ID:6290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6290 is located from position 58083077 to position 58083172 relative to chromosome 17 on the `+` strand.

GAM336933 precursor RNA folds onto itself, forming GAM336933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336933 precursor RNA, designated SEQ ID NO: 6290, and a schematic representation of a predicted secondary folding of GAM336933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336933 folded precursor RNA yielding a GAM336933 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336933 RNA, hereby incorporated herein. Expression of GAM336933 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336933 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336933 target RNA, herein designated GAM TARGET RNA.

GAM336933 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336933 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336933 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336933 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336933 RNA, herein designated GAM RNA, to target binding sites on GAM336933 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336933 target RNA into GAM336933 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336933 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336933 target genes. The mRNA of each one of this plurality of GAM336933 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336933 RNA, herein designated GAM RNA, and which when bound by GAM336933 RNA causes inhibition of translation of the GAM336933 target mRNA into a corresponding GAM336933 target protein.

The mechanism of the translational inhibition exerted by GAM336933 RNA, herein designated GAM RNA, on one or more GAM336933 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336933 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336933 RNA, herein designated GAM RNA, of GAM336933 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336933 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336933 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336933 RNA correlate with, and may be deduced from, the identity of the GAM336933 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336934 7170 TGAGGCCGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATCGCTTG detected oligonucleotides of the present invention, referred to here as Genomic Address
AACCCTAGAG Messenger 336934 (GAM336934) oligonucleotides modulates expression of respective target
GCAGGTTGCA genes whose function and utility is known in the art.

GTGAGCCCAG GAM336934 is a novel bioinformatically detectable regulatory, non protein
ATTGCATCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336934 was detected
CACTGCACTC is described with additional reference to Figs. 9-15.

CAGCCTGGGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AACAGAGGGA encoded by the human genome.

GACTCCATCT GAM336934 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM336934 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336934 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336934 precursor RNA is designated SEQ ID:7170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7170 is located from position 58103929 to position 58104030 relative to chromosome 17 on the `+` strand.

GAM336934 precursor RNA folds onto itself, forming GAM336934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336934 precursor RNA, designated SEQ ID NO: 7170, and a schematic representation of a predicted secondary folding of GAM336934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336934 folded precursor RNA yielding a GAM336934 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336934 RNA, hereby incorporated herein. Expression of GAM336934 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336934 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336934 target RNA, herein designated GAM TARGET RNA.

GAM336934 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336934 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336934 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336934 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336934 RNA, herein designated GAM RNA, to target binding sites on GAM336934 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336934 target RNA into GAM336934 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336934 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336934 target genes. The mRNA of each one of this plurality of GAM336934 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336934 RNA, herein designated GAM RNA, and which when bound by GAM336934 RNA causes inhibition of translation of the GAM336934 target mRNA into a corresponding GAM336934 target protein.

The mechanism of the translational inhibition exerted by GAM336934 RNA, herein designated GAM RNA, on one or more GAM336934 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336934 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336934 RNA, herein designated GAM RNA, of GAM336934 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336934 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336934 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336934 RNA correlate with, and may be deduced from, the identity of the GAM336934 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336937 5956 ATCATCAGGC Fig. 8 further provides a conceptual description of another novel bioinformatically

CATAAGGAGC Messenger 336937 (GAM336937) oligonucleotides modulates expression of respective target
ACACAACCTA genes whose function and utility is known in the art.

GATTGCTAGC GAM336937 is a novel bioinformatically detectable regulatory, non protein
AGGCACAGTT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336937 was detected
CACAATAGGG is described with additional reference to Figs. 9-15.

TTCGTTCTCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TGTGAGAATG encoded by the human genome.

GCATGCCGCT GAM336937 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GCTGAT GAM336937 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336937 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336937 precursor RNA is designated SEQ ID:5956, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5956 is located from position 58596055 to position 58596160 relative to chromosome 17 on the `+` strand.

GAM336937 precursor RNA folds onto itself, forming GAM336937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336937 precursor RNA, designated SEQ ID NO: 5956, and a schematic representation of a predicted secondary folding of GAM336937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336937 folded precursor RNA yielding a GAM336937 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA

precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336937 RNA, hereby incorporated herein.

GAM336937 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336937 target RNA, herein designated GAM TARGET RNA.

GAM336937 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336937 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336937 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336937 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336937 RNA, herein designated GAM RNA, to target binding sites on GAM336937 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336937 target RNA into GAM336937 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336937 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336937 target genes. The mRNA of each one of this plurality of GAM336937 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336937 RNA, herein designated GAM RNA, and which when bound by GAM336937 RNA causes inhibition of translation of the GAM336937 target mRNA into a corresponding GAM336937 target protein.

The mechanism of the translational inhibition exerted by GAM336937 RNA, herein designated GAM RNA, on one or more GAM336937 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336937 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336937 RNA, herein designated GAM RNA, of

GAM336937 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336937 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336937 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336937 RNA correlate with, and may be deduced from, the identity of the GAM336937 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336938 6742 GGCATTAGAT Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTCATAAGG detected oligonucleotides of the present invention, referred to here as Genomic Address

AGCACACAAC Messenger 336938 (GAM336938) oligonucleotides modulates expression of respective target

CTAGATTGCT genes whose function and utility is known in the art.

AGCAGGCACA GAM336938 is a novel bioinformatically detectable regulatory, non protein

GTTCACAATA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336938 was detected

GGGTTCGTTC is described with additional reference to Figs. 9-15.

TCCTGTGAGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

ATGGCATGCC encoded by the human genome.

GAM336938 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336938 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336938 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336938 precursor RNA is designated SEQ ID:6742, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6742 is located from position 58596062 to position 58596151 relative to chromosome 17 on the `+` strand.

GAM336938 precursor RNA folds onto itself, forming GAM336938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336938 precursor RNA, designated SEQ ID NO: 6742, and

a schematic representation of a predicted secondary folding of GAM336938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336938 folded precursor RNA yielding a GAM336938 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336938 RNA, hereby incorporated herein.

GAM336938 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336938 target RNA, herein designated GAM TARGET RNA.

GAM336938 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336938 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336938 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336938 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336938 RNA, herein designated GAM RNA, to target binding sites on GAM336938 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336938 target RNA into GAM336938 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336938 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336938 target genes. The mRNA of each one of this plurality of GAM336938 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336938 RNA, herein designated GAM RNA, and which when bound by GAM336938 RNA causes inhibition of translation of the GAM336938 target mRNA into a corresponding GAM336938 target protein.

The mechanism of the translational inhibition exerted by GAM336938 RNA, herein designated GAM RNA, on one or more GAM336938 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336938 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336938 RNA, herein designated GAM RNA, of GAM336938 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336938 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336938 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336938 RNA correlate with, and may be deduced from, the identity of the GAM336938 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336939 6885 GTCTAGGTCT Fig. 8 further provides a conceptual description of another novel bioinformatically

GATAATTTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

ATTCATTTCT Messenger 336939 (GAM336939) oligonucleotides modulates expression of respective target

TTCATGGACA genes whose function and utility is known in the art.

TGGTGACTCT GAM336939 is a novel bioinformatically detectable regulatory, non protein

TTTCTTGCCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336939 was detected

TCCTTAAGGA is described with additional reference to Figs. 9-15.

GAAAAGCCAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GGACACTACA encoded by the human genome.

AAATCTTTGA GAM336939 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGTTTGAAGT GAM336939 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GGGAACTAGG GAM336939 precursor RNA does not encode a protein. A nucleotide sequence identical or

AGATTCAGGC highly similar to the nucleotide sequence of GAM336939 precursor RNA is designated SEQ

ID:6885, and is provided hereinbelow with reference to the sequence listing part.
Nucleotide sequence SEQ ID:6885 is located from position 58665635 to position 58665764 relative to chromosome 12 on the `+` strand.

GAM336939 precursor RNA folds onto itself, forming GAM336939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336939 precursor RNA, designated SEQ ID NO: 6885, and a schematic representation of a predicted secondary folding of GAM336939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336939 folded precursor RNA yielding a GAM336939 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336939 RNA, hereby incorporated herein.

GAM336939 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336939 target RNA, herein designated GAM TARGET RNA.

GAM336939 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336939 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336939 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336939 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336939 RNA, herein designated GAM RNA, to target binding sites on GAM336939 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336939 target RNA into GAM336939 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336939 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336939 target genes. The mRNA of each one of this

plurality of GAM336939 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336939 RNA, herein designated GAM RNA, and which when bound by GAM336939 RNA causes inhibition of translation of the GAM336939 target mRNA into a corresponding GAM336939 target protein.

The mechanism of the translational inhibition exerted by GAM336939 RNA, herein designated GAM RNA, on one or more GAM336939 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336939 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336939 RNA, herein designated GAM RNA, of GAM336939 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336939 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336939 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336939 RNA correlate with, and may be deduced from, the identity of the GAM336939 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336941 5874 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336941 (GAM336941) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336941 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336941 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336941 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336941 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336941 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336941 precursor RNA is designated SEQ ID:5874, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5874 is located from position 59119812 to position 59119893 relative to chromosome 4 on the `-` strand.

GAM336941 precursor RNA folds onto itself, forming GAM336941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336941 precursor RNA, designated SEQ ID NO: 5874, and a schematic representation of a predicted secondary folding of GAM336941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336941 folded precursor RNA yielding a GAM336941 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336941 RNA, hereby incorporated herein.

GAM336941 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336941 target RNA, herein designated GAM TARGET RNA.

GAM336941 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336941 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336941 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336941 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336941 RNA, herein designated GAM RNA, to target binding sites on GAM336941 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336941 target RNA into GAM336941 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336941 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336941 target genes. The mRNA of each one of this plurality of GAM336941 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336941 RNA, herein designated GAM RNA, and which when bound by GAM336941 RNA causes inhibition of translation of the GAM336941 target mRNA into a corresponding GAM336941 target protein.

The mechanism of the translational inhibition exerted by GAM336941 RNA, herein designated GAM RNA, on one or more GAM336941 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336941 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336941 RNA, herein designated GAM RNA, of GAM336941 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336941 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336941 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336941 RNA correlate with, and may be deduced from, the identity of the GAM336941 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336942 7242 TGGGGTACTG Fig. 8 further provides a conceptual description of another novel bioinformatically
AGAGTCAAAG detected oligonucleotides of the present invention, referred to here as Genomic Address
ACTTGGCTGT Messenger 336942 (GAM336942) oligonucleotides modulates expression of respective target
CAGCCCTGAG genes whose function and utility is known in the art.

TCTGCCTCAA GAM336942 is a novel bioinformatically detectable regulatory, non protein
CCTCCAAGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336942 was detected
TCATAGCCAC is described with additional reference to Figs. 9-15.

GGCTTCACCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTGTGCCTC encoded by the human genome.

A GAM336942 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336942 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336942 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336942 precursor RNA is designated SEQ ID:7242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7242 is located from position 59207699 to position 59207789 relative to chromosome 11 on the `+` strand.

GAM336942 precursor RNA folds onto itself, forming GAM336942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336942 precursor RNA, designated SEQ ID NO: 7242, and a schematic representation of a predicted secondary folding of GAM336942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336942 folded precursor RNA yielding a GAM336942 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336942 RNA, hereby incorporated herein.

GAM336942 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336942 target RNA, herein designated GAM TARGET RNA.

GAM336942 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336942 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336942 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336942 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be

present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336942 RNA, herein designated GAM RNA, to target binding sites on GAM336942 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336942 target RNA into GAM336942 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336942 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336942 target genes. The mRNA of each one of this plurality of GAM336942 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336942 RNA, herein designated GAM RNA, and which when bound by GAM336942 RNA causes inhibition of translation of the GAM336942 target mRNA into a corresponding GAM336942 target protein.

The mechanism of the translational inhibition exerted by GAM336942 RNA, herein designated GAM RNA, on one or more GAM336942 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336942 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336942 RNA, herein designated GAM RNA, of GAM336942 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336942 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336942 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336942 RNA correlate with, and may be deduced from, the identity of the GAM336942 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336945 6236 CTGTAATTCC Fig. 8 further provides a conceptual description of another novel bioinformatically

AGCACTTTGG detected oligonucleotides of the present invention, referred to here as Genomic Address

GATGCCGAGT Messenger 336945 (GAM336945) oligonucleotides modulates expression of respective target

TGAGAGGATC genes whose function and utility is known in the art.

ACTTGAAGCC GAM336945 is a novel bioinformatically detectable regulatory, non protein
GGGAATTTGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336945 was detected
GGCTGCAGTG is described with additional reference to Figs. 9-15.

AGCTATGATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ATGCCGGTGT encoded by the human genome.

ACTTCAGTCT GAM336945 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGGCAACAG GAM336945 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336945 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336945 precursor RNA is designated SEQ ID:6236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6236 is located from position 59990343 to position 59990451 relative to chromosome 18 on the `+` strand.

GAM336945 precursor RNA folds onto itself, forming GAM336945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336945 precursor RNA, designated SEQ ID NO: 6236, and a schematic representation of a predicted secondary folding of GAM336945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336945 folded precursor RNA yielding a GAM336945 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336945 RNA, hereby incorporated herein.

GAM336945 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336945 target RNA, herein designated GAM TARGET RNA.

GAM336945 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336945 RNA, herein designated GAM RNA, binds complementarily to one or more

target binding sites located in untranslated regions of GAM336945 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336945 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336945 RNA, herein designated GAM RNA, to target binding sites on GAM336945 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336945 target RNA into GAM336945 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336945 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336945 target genes. The mRNA of each one of this plurality of GAM336945 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336945 RNA, herein designated GAM RNA, and which when bound by GAM336945 RNA causes inhibition of translation of the GAM336945 target mRNA into a corresponding GAM336945 target protein.

The mechanism of the translational inhibition exerted by GAM336945 RNA, herein designated GAM RNA, on one or more GAM336945 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336945 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336945 RNA, herein designated GAM RNA, of GAM336945 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336945 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336945 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336945 RNA correlate with, and may be deduced from, the identity of the GAM336945 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TGCATGGAGC detected oligonucleotides of the present invention, referred to here as Genomic Address
TGTAGTTTTT Messenger 336946 (GAM336946) oligonucleotides modulates expression of respective target
CCCACATTCC genes whose function and utility is known in the art.

TCTTAGGAGC GAM336946 is a novel bioinformatically detectable regulatory, non protein
TGTGCCTAAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336946 was detected
ATGCTGCGCT is described with additional reference to Figs. 9-15.

AGCAACCTCT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GTATTGTGAA encoded by the human genome.

GGAACT GAM336946 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336946 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336946 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336946 precursor RNA is designated SEQ ID:5823, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5823 is located from position 60087508 to position 60087603 relative to chromosome 20 on the `+` strand.

GAM336946 precursor RNA folds onto itself, forming GAM336946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336946 precursor RNA, designated SEQ ID NO: 5823, and a schematic representation of a predicted secondary folding of GAM336946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336946 folded precursor RNA yielding a GAM336946 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336946 RNA, hereby incorporated herein.

GAM336946 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336946 target RNA, herein designated GAM TARGET RNA.

GAM336946 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336946 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336946 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336946 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336946 RNA, herein designated GAM RNA, to target binding sites on GAM336946 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336946 target RNA into GAM336946 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336946 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336946 target genes. The mRNA of each one of this plurality of GAM336946 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336946 RNA, herein designated GAM RNA, and which when bound by GAM336946 RNA causes inhibition of translation of the GAM336946 target mRNA into a corresponding GAM336946 target protein.

The mechanism of the translational inhibition exerted by GAM336946 RNA, herein designated GAM RNA, on one or more GAM336946 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336946 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336946 RNA, herein designated GAM RNA, of GAM336946 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336946 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336946 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336946 RNA correlate with, and may be deduced from, the identity of the GAM336946 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TCTGTGGTCT Messenger 336947 (GAM336947) oligonucleotides modulates expression of respective target
TGTTCAGGAA genes whose function and utility is known in the art.

TTTACAAACT GAM336947 is a novel bioinformatically detectable regulatory, non protein
AGAGGAAGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336947 was detected
TTATCTCACC is described with additional reference to Figs. 9-15.

AAGGGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336947 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336947 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336947 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336947 precursor RNA is designated SEQ ID:7045, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7045 is located from position 60363185 to position 60363260 relative to chromosome 15 on the `+` strand.

GAM336947 precursor RNA folds onto itself, forming GAM336947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336947 precursor RNA, designated SEQ ID NO: 7045, and a schematic representation of a predicted secondary folding of GAM336947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336947 folded precursor

RNA yielding a GAM336947 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336947 RNA, hereby incorporated herein.

GAM336947 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336947 target RNA, herein designated GAM TARGET RNA.

GAM336947 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336947 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336947 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336947 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336947 RNA, herein designated GAM RNA, to target binding sites on GAM336947 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336947 target RNA into GAM336947 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336947 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336947 target genes. The mRNA of each one of this plurality of GAM336947 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336947 RNA, herein designated GAM RNA, and which when bound by GAM336947 RNA causes inhibition of translation of the GAM336947 target mRNA into a corresponding GAM336947 target protein.

The mechanism of the translational inhibition exerted by GAM336947 RNA, herein designated GAM RNA, on one or more GAM336947 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336947 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336947 RNA, herein designated GAM RNA, of GAM336947 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336947 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336947 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336947 RNA correlate with, and may be deduced from, the identity of the GAM336947 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336950 5875 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336950 (GAM336950) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336950 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336950 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336950 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336950 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336950 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336950 precursor RNA is designated SEQ ID:5875, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5875 is located from position 60746489 to position 60746570 relative to chromosome 17 on the `-` strand.

GAM336950 precursor RNA folds onto itself, forming GAM336950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336950 precursor RNA, designated SEQ ID NO: 5875, and a schematic representation of a predicted secondary folding of GAM336950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336950 folded precursor RNA yielding a GAM336950 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336950 RNA, hereby incorporated herein.

GAM336950 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336950 target RNA, herein designated GAM TARGET RNA.

GAM336950 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336950 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336950 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336950 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336950 RNA, herein designated GAM RNA, to target binding sites on GAM336950 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336950 target RNA into GAM336950 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336950 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336950 target genes. The mRNA of each one of this plurality of GAM336950 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336950 RNA, herein designated GAM RNA, and which when bound by GAM336950 RNA causes inhibition of translation of the GAM336950 target mRNA into a corresponding GAM336950 target protein.

The mechanism of the translational inhibition exerted by GAM336950 RNA, herein designated GAM RNA, on one or more GAM336950 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational

inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336950 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336950 RNA, herein designated GAM RNA, of GAM336950 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336950 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336950 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336950 RNA correlate with, and may be deduced from, the identity of the GAM336950 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336951 6166 CTCCCCCGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

AATGTCAGCC detected oligonucleotides of the present invention, referred to here as Genomic Address

CCTTGAAGCT Messenger 336951 (GAM336951) oligonucleotides modulates expression of respective target

GCGGTCTGTC genes whose function and utility is known in the art.

TATGCTGGTC GAM336951 is a novel bioinformatically detectable regulatory, non protein

GTACCCTCAG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336951 was detected

AGCCTAAGAT is described with additional reference to Figs. 9-15.

GACACAGAGC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCAGGAAATG encoded by the human genome.

AACACCCTCG GAM336951 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAGGGGG GAM336951 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336951 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336951 precursor RNA is designated SEQ ID:6166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6166 is located from position 60952390 to position 60952496 relative to chromosome 11 on the `+` strand.

GAM336951 precursor RNA folds onto itself, forming GAM336951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336951 precursor RNA, designated SEQ ID NO: 6166, and a schematic representation of a predicted secondary folding of GAM336951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336951 folded precursor RNA yielding a GAM336951 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336951 RNA, hereby incorporated herein.

GAM336951 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336951 target RNA, herein designated GAM TARGET RNA.

GAM336951 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336951 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336951 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336951 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336951 RNA, herein designated GAM RNA, to target binding sites on GAM336951 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336951 target RNA into GAM336951 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336951 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336951 target genes. The mRNA of each one of this

plurality of GAM336951 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336951 RNA, herein designated GAM RNA, and which when bound by GAM336951 RNA causes inhibition of translation of the GAM336951 target mRNA into a corresponding GAM336951 target protein.

The mechanism of the translational inhibition exerted by GAM336951 RNA, herein designated GAM RNA, on one or more GAM336951 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336951 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336951 RNA, herein designated GAM RNA, of GAM336951 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336951 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336951 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336951 RNA correlate with, and may be deduced from, the identity of the GAM336951 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336956 7186 TGAGTAAGAG Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGTGGGGA detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTTTGAGAG Messenger 336956 (GAM336956) oligonucleotides modulates expression of respective target

ACATCGTAAT genes whose function and utility is known in the art.

GGCTGTCCAC GAM336956 is a novel bioinformatically detectable regulatory, non protein

CACAGTCTTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336956 was detected

CTCCGTCCCC is described with additional reference to Figs. 9-15.

ACCTCCCAGT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GATTCA encoded by the human genome.

GAM336956 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336956 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336956 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336956 precursor RNA is designated SEQ ID:7186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7186 is located from position 61750038 to position 61750123 relative to chromosome 19 on the `+` strand.

GAM336956 precursor RNA folds onto itself, forming GAM336956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336956 precursor RNA, designated SEQ ID NO: 7186, and a schematic representation of a predicted secondary folding of GAM336956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336956 folded precursor RNA yielding a GAM336956 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336956 RNA, hereby incorporated herein.

GAM336956 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336956 target RNA, herein designated GAM TARGET RNA.

GAM336956 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336956 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336956 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336956 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336956 RNA, herein designated GAM RNA, to target binding sites on GAM336956 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336956 target RNA into GAM336956 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336956 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336956 target genes. The mRNA of each one of this plurality of GAM336956 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336956 RNA, herein designated GAM RNA, and which when bound by GAM336956 RNA causes inhibition of translation of the GAM336956 target mRNA into a corresponding GAM336956 target protein.

The mechanism of the translational inhibition exerted by GAM336956 RNA, herein designated GAM RNA, on one or more GAM336956 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336956 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336956 RNA, herein designated GAM RNA, of GAM336956 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336956 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336956 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336956 RNA correlate with, and may be deduced from, the identity of the GAM336956 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AAACACATTT GAM336957 is a novel bioinformatically detectable regulatory, non protein
ATTTTCCCCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336957 was detected
TTTAAACTTC is described with additional reference to Figs. 9-15.

CCTGCTGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CAGTCTTTGC encoded by the human genome.

CTTCTT GAM336957 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336957 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336957 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336957 precursor RNA is designated SEQ ID:5660, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5660 is located from position 61814814 to position 61814909 relative to chromosome 11 on the `-` strand.

GAM336957 precursor RNA folds onto itself, forming GAM336957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336957 precursor RNA, designated SEQ ID NO: 5660, and a schematic representation of a predicted secondary folding of GAM336957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336957 folded precursor RNA yielding a GAM336957 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336957 RNA, hereby incorporated herein.

GAM336957 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336957 target RNA, herein designated GAM TARGET RNA.

GAM336957 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336957 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336957 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336957 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in

Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336957 RNA, herein designated GAM RNA, to target binding sites on GAM336957 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336957 target RNA into GAM336957 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336957 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336957 target genes. The mRNA of each one of this plurality of GAM336957 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336957 RNA, herein designated GAM RNA, and which when bound by GAM336957 RNA causes inhibition of translation of the GAM336957 target mRNA into a corresponding GAM336957 target protein.

The mechanism of the translational inhibition exerted by GAM336957 RNA, herein designated GAM RNA, on one or more GAM336957 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336957 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336957 RNA, herein designated GAM RNA, of GAM336957 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336957 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336957 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336957 RNA correlate with, and may be deduced from, the identity of the GAM336957 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CTGCCAGCCT Messenger 336958 (GAM336958) oligonucleotides modulates expression of respective target
GTGTGATCAA genes whose function and utility is known in the art.

TCCTGCGGTT GAM336958 is a novel bioinformatically detectable regulatory, non protein
AGGAAGGTGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336958 was detected
AGTTTTGCTT is described with additional reference to Figs. 9-15.

TCCCATCTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TC encoded by the human genome.

GAM336958 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336958 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336958 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336958 precursor RNA is designated SEQ ID:6283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6283 is located from position 61985320 to position 61985401 relative to chromosome 11 on the `-` strand.

GAM336958 precursor RNA folds onto itself, forming GAM336958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336958 precursor RNA, designated SEQ ID NO: 6283, and a schematic representation of a predicted secondary folding of GAM336958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336958 folded precursor RNA yielding a GAM336958 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336958 RNA, hereby incorporated herein.

GAM336958 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336958 target RNA, herein designated GAM TARGET RNA.

GAM336958 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336958 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336958 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336958 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336958 RNA, herein designated GAM RNA, to target binding sites on GAM336958 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336958 target RNA into GAM336958 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336958 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336958 target genes. The mRNA of each one of this plurality of GAM336958 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336958 RNA, herein designated GAM RNA, and which when bound by GAM336958 RNA causes inhibition of translation of the GAM336958 target mRNA into a corresponding GAM336958 target protein.

The mechanism of the translational inhibition exerted by GAM336958 RNA, herein designated GAM RNA, on one or more GAM336958 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336958 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336958 RNA, herein designated GAM RNA, of GAM336958 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336958 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336958 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336958 RNA correlate with, and may be deduced from, the identity of the GAM336958 target gene

inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336959 5876 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically
TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address
CAACATGCAG Messenger 336959 (GAM336959) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336959 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336959 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336959 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336959 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336959 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336959 precursor RNA is designated SEQ ID:5876, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5876 is located from position 62004748 to position 62004829 relative to chromosome X on the `+` strand.

GAM336959 precursor RNA folds onto itself, forming GAM336959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336959 precursor RNA, designated SEQ ID NO: 5876, and a schematic representation of a predicted secondary folding of GAM336959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336959 folded precursor RNA yielding a GAM336959 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336959 RNA, hereby incorporated herein.

GAM336959 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336959 target RNA, herein designated GAM TARGET RNA.

GAM336959 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336959 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336959 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336959 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336959 RNA, herein designated GAM RNA, to target binding sites on GAM336959 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336959 target RNA into GAM336959 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336959 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336959 target genes. The mRNA of each one of this plurality of GAM336959 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336959 RNA, herein designated GAM RNA, and which when bound by GAM336959 RNA causes inhibition of translation of the GAM336959 target mRNA into a corresponding GAM336959 target protein.

The mechanism of the translational inhibition exerted by GAM336959 RNA, herein designated GAM RNA, on one or more GAM336959 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336959 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336959 RNA, herein designated GAM RNA, of GAM336959 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING

SITE-II and BINDING SITE-III of Fig. 8, found on GAM336959 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336959 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336959 RNA correlate with, and may be deduced from, the identity of the GAM336959 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336961 5948 ATAAGCTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically
CTAATTGCCA detected oligonucleotides of the present invention, referred to here as Genomic Address
AGAATTCACA Messenger 336961 (GAM336961) oligonucleotides modulates expression of respective target
TGTGGTTGTA genes whose function and utility is known in the art.

TGCAGCTTTA GAM336961 is a novel bioinformatically detectable regulatory, non protein
CTGGGAGACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336961 was detected
GAAGTGTATC is described with additional reference to Figs. 9-15.

TGCATGTGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTGCTGTGA encoded by the human genome.

TGGACACTTG GAM336961 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
TAAGTTTGT GAM336961 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336961 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336961 precursor RNA is designated SEQ ID:5948, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5948 is located from position 62131101 to position 62131209 relative to chromosome 9 on the `-` strand.

GAM336961 precursor RNA folds onto itself, forming GAM336961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336961 precursor RNA, designated SEQ ID NO: 5948, and a schematic representation of a predicted secondary folding of GAM336961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336961 folded precursor RNA yielding a GAM336961 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336961 RNA, hereby incorporated herein.

GAM336961 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336961 target RNA, herein designated GAM TARGET RNA.

GAM336961 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336961 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336961 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336961 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336961 RNA, herein designated GAM RNA, to target binding sites on GAM336961 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336961 target RNA into GAM336961 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336961 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336961 target genes. The mRNA of each one of this plurality of GAM336961 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336961 RNA, herein designated GAM RNA, and which when bound by GAM336961 RNA causes inhibition of translation of the GAM336961 target mRNA into a corresponding GAM336961 target protein.

The mechanism of the translational inhibition exerted by GAM336961 RNA, herein designated GAM RNA, on one or more GAM336961 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336961 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336961 RNA, herein designated GAM RNA, of GAM336961 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336961 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336961 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336961 RNA correlate with, and may be deduced from, the identity of the GAM336961 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

Fig. 8 further provides a conceptual description of another novel bioinformatically detected oligonucleotides of the present invention, referred to here as Genomic Address Messenger 336962 (GAM336962) oligonucleotides modulates expression of respective target genes whose function and utility is known in the art.

GAM336962 is a novel bioinformatically detectable regulatory, non protein coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336962 was detected is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM336962 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336962 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM336962 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336962 precursor RNA is designated SEQ ID:6960, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6960 is located from position 62164421 to position 62164526 relative to chromosome 20 on the `-` strand.

GAM336962 precursor RNA folds onto itself, forming GAM336962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336962 precursor RNA, designated SEQ ID NO: 6960, and a schematic representation of a predicted secondary folding of GAM336962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336962 folded precursor RNA yielding a GAM336962 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336962 RNA, hereby incorporated herein.

GAM336962 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336962 target RNA, herein designated GAM TARGET RNA.

GAM336962 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336962 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336962 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336962 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336962 RNA, herein designated GAM RNA, to target binding sites on GAM336962 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336962 target RNA into GAM336962 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336962 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336962 target genes. The mRNA of each one of this plurality of GAM336962 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336962 RNA, herein designated GAM RNA, and which when bound by GAM336962 RNA causes inhibition of translation of the GAM336962 target mRNA into a corresponding GAM336962 target protein.

The mechanism of the translational inhibition exerted by GAM336962 RNA, herein

designated GAM RNA, on one or more GAM336962 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336962 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336962 RNA, herein designated GAM RNA, of GAM336962 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336962 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336962 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336962 RNA correlate with, and may be deduced from, the identity of the GAM336962 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

AGGAGGAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGGAAGC encoded by the human genome.

TAG GAM336963 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336963 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336963 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336963 precursor RNA is designated SEQ ID:7286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7286 is located from position 62264330 to position 62264422

relative to chromosome 8 on the `-` strand.

GAM336963 precursor RNA folds onto itself, forming GAM336963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336963 precursor RNA, designated SEQ ID NO: 7286, and a schematic representation of a predicted secondary folding of GAM336963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336963 folded precursor RNA yielding a GAM336963 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336963 RNA, hereby incorporated herein.

GAM336963 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336963 target RNA, herein designated GAM TARGET RNA.

GAM336963 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336963 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336963 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336963 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336963 RNA, herein designated GAM RNA, to target binding sites on GAM336963 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336963 target RNA into GAM336963 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336963 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336963 target genes. The mRNA of each one of this plurality of GAM336963 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336963 RNA, herein designated GAM RNA, and which when bound by GAM336963 RNA causes inhibition of translation of the GAM336963 target mRNA into a corresponding GAM336963 target protein.

The mechanism of the translational inhibition exerted by GAM336963 RNA, herein designated GAM RNA, on one or more GAM336963 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336963 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336963 RNA, herein designated GAM RNA, of GAM336963 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336963 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336963 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336963 RNA correlate with, and may be deduced from, the identity of the GAM336963 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336964 5877 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336964 (GAM336964) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336964 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336964 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336964 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336964 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336964 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336964 precursor RNA is designated SEQ ID:5877, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5877 is located from position 62270288 to position 62270369 relative to chromosome 5 on the `+` strand.

GAM336964 precursor RNA folds onto itself, forming GAM336964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336964 precursor RNA, designated SEQ ID NO: 5877, and a schematic representation of a predicted secondary folding of GAM336964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336964 folded precursor RNA yielding a GAM336964 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336964 RNA, hereby incorporated herein.

GAM336964 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336964 target RNA, herein designated GAM TARGET RNA.

GAM336964 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336964 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336964 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336964 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336964 RNA, herein designated GAM RNA, to target

binding sites on GAM336964 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336964 target RNA into GAM336964 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336964 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336964 target genes. The mRNA of each one of this plurality of GAM336964 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336964 RNA, herein designated GAM RNA, and which when bound by GAM336964 RNA causes inhibition of translation of the GAM336964 target mRNA into a corresponding GAM336964 target protein.

The mechanism of the translational inhibition exerted by GAM336964 RNA, herein designated GAM RNA, on one or more GAM336964 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336964 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336964 RNA, herein designated GAM RNA, of GAM336964 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336964 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336964 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336964 RNA correlate with, and may be deduced from, the identity of the GAM336964 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336965 6277 CTTTTTCCTC Fig. 8 further provides a conceptual description of another novel bioinformatically

CAGTGAACGG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGACTTGACA Messenger 336965 (GAM336965) oligonucleotides modulates expression of respective target

GAGGTACATA genes whose function and utility is known in the art.

GGAGGCTACT GAM336965 is a novel bioinformatically detectable regulatory, non protein

TGTTCTCTTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336965 was detected

TTGGCTGCTT is described with additional reference to Figs. 9-15.

GTATTTGCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TCTGGAAGGT encoded by the human genome.

TATTGTTTTC GAM336965 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AAGGATCTTA GAM336965 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

AG GAM336965 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336965 precursor RNA is designated SEQ ID:6277, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6277 is located from position 62330677 to position 62330788 relative to chromosome 14 on the `+` strand.

GAM336965 precursor RNA folds onto itself, forming GAM336965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336965 precursor RNA, designated SEQ ID NO: 6277, and a schematic representation of a predicted secondary folding of GAM336965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336965 folded precursor RNA yielding a GAM336965 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336965 RNA, hereby incorporated herein.

GAM336965 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336965 target RNA, herein designated GAM TARGET RNA.

GAM336965 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336965 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336965 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336965 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336965 RNA, herein designated GAM RNA, to target binding sites on GAM336965 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336965 target RNA into GAM336965 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336965 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336965 target genes. The mRNA of each one of this plurality of GAM336965 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336965 RNA, herein designated GAM RNA, and which when bound by GAM336965 RNA causes inhibition of translation of the GAM336965 target mRNA into a corresponding GAM336965 target protein.

The mechanism of the translational inhibition exerted by GAM336965 RNA, herein designated GAM RNA, on one or more GAM336965 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336965 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336965 RNA, herein designated GAM RNA, of GAM336965 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336965 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336965 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336965 RNA correlate with, and may be deduced from, the identity of the GAM336965 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336966 7038 TCCTCCAGTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AACGGTGACT detected oligonucleotides of the present invention, referred to here as Genomic Address
TGACAGAGGT Messenger 336966 (GAM336966) oligonucleotides modulates expression of respective target
ACATAGGAGG genes whose function and utility is known in the art.

CTACTTGTTC GAM336966 is a novel bioinformatically detectable regulatory, non protein
TCTTGTTGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336966 was detected
TGCTTGTATT is described with additional reference to Figs. 9-15.

TGCTTTCTGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
AAGGTTATTG encoded by the human genome.

TTTTCAAGGA GAM336966 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336966 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336966 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336966 precursor RNA is designated SEQ ID:7038, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7038 is located from position 62330682 to position 62330781 relative to chromosome 14 on the `+` strand.

GAM336966 precursor RNA folds onto itself, forming GAM336966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336966 precursor RNA, designated SEQ ID NO: 7038, and a schematic representation of a predicted secondary folding of GAM336966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336966 folded precursor RNA yielding a GAM336966 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336966 RNA, hereby incorporated herein.

GAM336966 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336966 target RNA, herein designated GAM TARGET RNA.

GAM336966 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336966 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336966 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336966 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336966 RNA, herein designated GAM RNA, to target binding sites on GAM336966 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336966 target RNA into GAM336966 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336966 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336966 target genes. The mRNA of each one of this plurality of GAM336966 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336966 RNA, herein designated GAM RNA, and which when bound by GAM336966 RNA causes inhibition of translation of the GAM336966 target mRNA into a corresponding GAM336966 target protein.

The mechanism of the translational inhibition exerted by GAM336966 RNA, herein designated GAM RNA, on one or more GAM336966 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336966 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336966 RNA, herein designated GAM RNA, of GAM336966 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336966 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336966 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336966 RNA correlate with, and may be deduced from, the identity of the GAM336966 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336967 7283 TGTTTTGACT Fig. 8 further provides a conceptual description of another novel bioinformatically

CCTTAGGTCT Messenger 336967 (GAM336967) oligonucleotides modulates expression of respective target
GGAATGGTAG genes whose function and utility is known in the art.

AGCATTGAGT GAM336967 is a novel bioinformatically detectable regulatory, non protein
ACTGTTATCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336967 was detected
TCCACATCTC is described with additional reference to Figs. 9-15.

AGGAGAAGGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GGCAGTAGAG encoded by the human genome.

AGACA GAM336967 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM336967 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336967 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336967 precursor RNA is designated SEQ ID:7283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7283 is located from position 62410126 to position 62410220 relative to chromosome 11 on the `+` strand.

GAM336967 precursor RNA folds onto itself, forming GAM336967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336967 precursor RNA, designated SEQ ID NO: 7283, and a schematic representation of a predicted secondary folding of GAM336967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336967 folded precursor RNA yielding a GAM336967 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins.

Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336967 RNA, hereby incorporated herein.

GAM336967 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336967 target RNA, herein designated GAM TARGET RNA.

GAM336967 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336967 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336967 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336967 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336967 RNA, herein designated GAM RNA, to target binding sites on GAM336967 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336967 target RNA into GAM336967 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336967 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336967 target genes. The mRNA of each one of this plurality of GAM336967 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336967 RNA, herein designated GAM RNA, and which when bound by GAM336967 RNA causes inhibition of translation of the GAM336967 target mRNA into a corresponding GAM336967 target protein.

The mechanism of the translational inhibition exerted by GAM336967 RNA, herein designated GAM RNA, on one or more GAM336967 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336967 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336967 RNA, herein designated GAM RNA, of GAM336967 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336967 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336967 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336967 RNA correlate with, and may be deduced from, the identity of the GAM336967 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336968 6168 CTCCTGTAGT Fig. 8 further provides a conceptual description of another novel bioinformatically

TTCTCTTGAA Messenger 336968 (GAM336968) oligonucleotides modulates expression of respective target
CCCTAATTTT genes whose function and utility is known in the art.

TAGGTCTCAA GAM336968 is a novel bioinformatically detectable regulatory, non protein
AGAGTGGGCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336968 was detected
TCAGAGATAA is described with additional reference to Figs. 9-15.

AGAGGTTTAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCAGGGACAG encoded by the human genome.

GGCGAGGAG GAM336968 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
GAM336968 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336968 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336968 precursor RNA is designated SEQ ID:6168, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6168 is located from position 62447485 to position 62447583 relative to chromosome 9 on the `+` strand.

GAM336968 precursor RNA folds onto itself, forming GAM336968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336968 precursor RNA, designated SEQ ID NO: 6168, and a schematic representation of a predicted secondary folding of GAM336968 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336968 folded precursor RNA yielding a GAM336968 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336968 RNA, hereby incorporated herein.

GAM336968 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336968 target RNA, herein designated GAM TARGET RNA.

GAM336968 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336968 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336968 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336968 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336968 RNA, herein designated GAM RNA, to target binding sites on GAM336968 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336968 target RNA into GAM336968 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336968 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336968 target genes. The mRNA of each one of this plurality of GAM336968 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336968 RNA, herein designated GAM RNA, and which when bound by GAM336968 RNA causes inhibition of translation of the GAM336968 target mRNA into a corresponding GAM336968 target protein.

The mechanism of the translational inhibition exerted by GAM336968 RNA, herein designated GAM RNA, on one or more GAM336968 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336968 precursor RNA, herein designated GAM PRECURSOR

RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336968 RNA, herein designated GAM RNA, of GAM336968 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth
in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336968 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336968 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336968 RNA correlate with, and may be deduced from, the identity of the GAM336968 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336969 5878 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

CAACATGCAG Messenger 336969 (GAM336969) oligonucleotides modulates expression of respective target
GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336969 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336969 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336969 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336969 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336969 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336969 precursor RNA is designated SEQ ID:5878, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5878 is located from position 62677320 to position 62677401 relative to chromosome 12 on the `-` strand.

GAM336969 precursor RNA folds onto itself, forming GAM336969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336969 precursor RNA, designated SEQ ID NO: 5878, and a schematic representation of a predicted secondary folding of GAM336969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336969 folded precursor RNA yielding a GAM336969 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336969 RNA, hereby incorporated herein.

GAM336969 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336969 target RNA, herein designated GAM TARGET RNA.

GAM336969 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336969 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336969 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336969 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336969 RNA, herein designated GAM RNA, to target binding sites on GAM336969 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336969 target RNA into GAM336969 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336969 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336969 target genes. The mRNA of each one of this plurality of GAM336969 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336969 RNA, herein designated GAM RNA, and which when bound by GAM336969 RNA causes inhibition of translation of the GAM336969 target mRNA into a corresponding GAM336969 target protein.

The mechanism of the translational inhibition exerted by GAM336969 RNA, herein designated GAM RNA, on one or more GAM336969 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336969 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336969 RNA, herein designated GAM RNA, of GAM336969 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336969 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336969 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336969 RNA correlate with, and may be deduced from, the identity of the GAM336969 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336970 5782 AGGCTGGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically

CTGTGACTCG detected oligonucleotides of the present invention, referred to here as Genomic Address

TACTTGTAAT Messenger 336970 (GAM336970) oligonucleotides modulates expression of respective target

CCTAGTGCTT genes whose function and utility is known in the art.

TGAGAGGCTG GAM336970 is a novel bioinformatically detectable regulatory, non protein

AGGCAGGAGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336970 was detected

ATTGCTTGAG is described with additional reference to Figs. 9-15.

ACCAGGAGTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGAGACCAGC encoded by the human genome.

CT GAM336970 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336970 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336970 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336970 precursor RNA is designated SEQ

ID:5782, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5782 is located from position 62689480 to position 62689571 relative to chromosome 12 on the `+` strand.

GAM336970 precursor RNA folds onto itself, forming GAM336970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336970 precursor RNA, designated SEQ ID NO: 5782, and a schematic representation of a predicted secondary folding of GAM336970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336970 folded precursor RNA yielding a GAM336970 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336970 RNA, hereby incorporated herein.

GAM336970 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336970 target RNA, herein designated GAM TARGET RNA.

GAM336970 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336970 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336970 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336970 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336970 RNA, herein designated GAM RNA, to target binding sites on GAM336970 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336970 target RNA into GAM336970 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336970 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336970 target genes. The mRNA of each one of this plurality of GAM336970 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336970 RNA, herein designated GAM RNA, and which when bound by GAM336970 RNA causes inhibition of translation of the GAM336970 target mRNA into a corresponding GAM336970 target protein.

The mechanism of the translational inhibition exerted by GAM336970 RNA, herein designated GAM RNA, on one or more GAM336970 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336970 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336970 RNA, herein designated GAM RNA, of GAM336970 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336970 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336970 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336970 RNA correlate with, and may be deduced from, the identity of the GAM336970 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336971 6764 GGCTGGGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

TGTGACTCGT detected oligonucleotides of the present invention, referred to here as Genomic Address

ACTTGTAATC Messenger 336971 (GAM336971) oligonucleotides modulates expression of respective target

CTAGTGCTTT genes whose function and utility is known in the art.

GAGAGGCTGA GAM336971 is a novel bioinformatically detectable regulatory, non protein

GGCAGGAGGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336971 was detected

TTGCTTGAGA is described with additional reference to Figs. 9-15.

CCAGGAGTTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

GAGACCAGCC encoded by the human genome.

GAM336971 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336971 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336971 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336971 precursor RNA is designated SEQ ID:6764, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6764 is located from position 62689481 to position 62689570 relative to chromosome 12 on the `+` strand.

GAM336971 precursor RNA folds onto itself, forming GAM336971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336971 precursor RNA, designated SEQ ID NO: 6764, and a schematic representation of a predicted secondary folding of GAM336971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336971 folded precursor RNA yielding a GAM336971 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336971 RNA, hereby incorporated herein.

GAM336971 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336971 target RNA, herein designated GAM TARGET RNA.

GAM336971 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336971 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336971 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336971 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336971 RNA, herein designated GAM RNA, to target binding sites on GAM336971 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336971 target RNA into GAM336971 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336971 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336971 target genes. The mRNA of each one of this plurality of GAM336971 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336971 RNA, herein designated GAM RNA, and which when bound by GAM336971 RNA causes inhibition of translation of the GAM336971 target mRNA into a corresponding GAM336971 target protein.

The mechanism of the translational inhibition exerted by GAM336971 RNA, herein designated GAM RNA, on one or more GAM336971 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336971 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336971 RNA, herein designated GAM RNA, of GAM336971 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336971 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336971 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336971 RNA correlate with, and may be deduced from, the identity of the GAM336971 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336972 5879 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336972 (GAM336972) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336972 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336972 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM336972 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336972 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336972 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336972 precursor RNA is designated SEQ ID:5879, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5879 is located from position 62708765 to position 62708846 relative to chromosome 13 on the `-` strand.

GAM336972 precursor RNA folds onto itself, forming GAM336972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336972 precursor RNA, designated SEQ ID NO: 5879, and a schematic representation of a predicted secondary folding of GAM336972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336972 folded precursor RNA yielding a GAM336972 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336972 RNA, hereby incorporated herein.

GAM336972 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336972 target RNA, herein designated GAM TARGET RNA.

GAM336972 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336972 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336972 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336972 RNA is a partial or fully complementary sequence of the

nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336972 RNA, herein designated GAM RNA, to target binding sites on GAM336972 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336972 target RNA into GAM336972 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336972 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336972 target genes. The mRNA of each one of this plurality of GAM336972 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336972 RNA, herein designated GAM RNA, and which when bound by GAM336972 RNA causes inhibition of translation of the GAM336972 target mRNA into a corresponding GAM336972 target protein.

The mechanism of the translational inhibition exerted by GAM336972 RNA, herein designated GAM RNA, on one or more GAM336972 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336972 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336972 RNA, herein designated GAM RNA, of GAM336972 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336972 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336972 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336972 RNA correlate with, and may be deduced from, the identity of the GAM336972 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

CAAGTGACTC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336974 was detected
AGTGGAAGAT is described with additional reference to Figs. 9-15.

CCAGAGTCAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CAGAGGCTCG encoded by the human genome.

TCA GAM336974 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336974 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336974 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336974 precursor RNA is designated SEQ ID:7190, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7190 is located from position 62725558 to position 62725650 relative to chromosome 11 on the `-` strand.

GAM336974 precursor RNA folds onto itself, forming GAM336974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336974 precursor RNA, designated SEQ ID NO: 7190, and a schematic representation of a predicted secondary folding of GAM336974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336974 folded precursor RNA yielding a GAM336974 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336974 RNA, hereby incorporated herein.

GAM336974 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336974 target RNA, herein designated GAM TARGET RNA.

GAM336974 target RNA comprises three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336974 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336974 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336974 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336974 RNA, herein designated GAM RNA, to target binding sites on GAM336974 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336974 target RNA into GAM336974 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336974 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336974 target genes. The mRNA of each one of this plurality of GAM336974 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336974 RNA, herein designated GAM RNA, and which when bound by GAM336974 RNA causes inhibition of translation of the GAM336974 target mRNA into a corresponding GAM336974 target protein.

The mechanism of the translational inhibition exerted by GAM336974 RNA, herein designated GAM RNA, on one or more GAM336974 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336974 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336974 RNA, herein designated GAM RNA, of GAM336974 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336974 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336974 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336974 RNA correlate with, and may be deduced from, the identity of the GAM336974 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336975 7178 TGAGGTAGGA Fig. 8 further provides a conceptual description of another novel bioinformatically

CGGTGAGCCG GAM336975 is a novel bioinformatically detectable regulatory, non protein
AGATTGTGCC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336975 was detected
ACTGCACTCC is described with additional reference to Figs. 9-15.

AGCCTGGGCA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
ACAAGAGCGA encoded by the human genome.

AACTCCGTCT GAM336975 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
CA GAM336975 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336975 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336975 precursor RNA is designated SEQ ID:7178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7178 is located from position 62729661 to position 62729762 relative to chromosome 11 on the `+` strand.

GAM336975 precursor RNA folds onto itself, forming GAM336975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336975 precursor RNA, designated SEQ ID NO: 7178, and a schematic representation of a predicted secondary folding of GAM336975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336975 folded precursor RNA yielding a GAM336975 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336975 RNA, hereby incorporated herein. Expression of GAM336975 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM336975 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336975 target RNA, herein designated GAM TARGET RNA.

GAM336975 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336975 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336975 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336975 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336975 RNA, herein designated GAM RNA, to target binding sites on GAM336975 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336975 target RNA into GAM336975 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336975 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336975 target genes. The mRNA of each one of this plurality of GAM336975 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336975 RNA, herein designated GAM RNA, and which when bound by GAM336975 RNA causes inhibition of translation of the GAM336975 target mRNA into a corresponding GAM336975 target protein.

The mechanism of the translational inhibition exerted by GAM336975 RNA, herein designated GAM RNA, on one or more GAM336975 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336975 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336975 RNA, herein designated GAM RNA, of GAM336975 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336975 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336975 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336975 RNA correlate with, and may be deduced from, the identity of the GAM336975 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336976 6122 CCTGGTCTTT Fig. 8 further provides a conceptual description of another novel bioinformatically

AAGAGTGATT detected oligonucleotides of the present invention, referred to here as Genomic Address

GGAGGCTGGG Messenger 336976 (GAM336976) oligonucleotides modulates expression of respective target

CATGGTGGCT genes whose function and utility is known in the art.

TATGCCTGTA GAM336976 is a novel bioinformatically detectable regulatory, non protein

ATCCCAGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336976 was detected

TTTGGGAGGC is described with additional reference to Figs. 9-15.

CAAGG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336976 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336976 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336976 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336976 precursor RNA is designated SEQ ID:6122, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6122 is located from position 62755250 to position 62755324 relative to chromosome 11 on the `+` strand.

GAM336976 precursor RNA folds onto itself, forming GAM336976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336976 precursor RNA, designated SEQ ID NO: 6122, and a schematic representation of a predicted secondary folding of GAM336976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336976 folded precursor RNA yielding a GAM336976 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336976 RNA, hereby incorporated herein.

GAM336976 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336976 target RNA, herein designated GAM TARGET RNA.

GAM336976 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336976 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336976 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336976 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336976 RNA, herein designated GAM RNA, to target binding sites on GAM336976 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336976 target RNA into GAM336976 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336976 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336976 target genes. The mRNA of each one of this plurality of GAM336976 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336976 RNA, herein designated GAM RNA, and which when bound by GAM336976 RNA causes inhibition of translation of the GAM336976 target mRNA into a corresponding GAM336976 target protein.

The mechanism of the translational inhibition exerted by GAM336976 RNA, herein designated GAM RNA, on one or more GAM336976 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336976 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336976 RNA, herein designated GAM RNA, of GAM336976 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336976 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336976 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336976 RNA correlate with, and may be deduced from, the identity of the GAM336976 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336978 6587 GGACATCAAA Fig. 8 further provides a conceptual description of another novel bioinformatically

GAATAAATAA detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGCTCTAA Messenger 336978 (GAM336978) oligonucleotides modulates expression of respective target

TTGCCAAGAA genes whose function and utility is known in the art.

TTCACATGTG GAM336978 is a novel bioinformatically detectable regulatory, non protein

GTTGTATGCA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336978 was detected

GCTTTACTGG is described with additional reference to Figs. 9-15.

GAGACTGAAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGTATCTGCA encoded by the human genome.

TGTGATTCTG GAM336978 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

CTGTGATGGA GAM336978 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

CACTTGTAAG GAM336978 precursor RNA does not encode a protein. A nucleotide sequence identical or

TTTGTGCC highly similar to the nucleotide sequence of GAM336978 precursor RNA is designated SEQ

ID:6587, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6587 is located from position 62875338 to position 62875465

relative to chromosome 9 on the `-` strand.

GAM336978 precursor RNA folds onto itself, forming GAM336978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336978 precursor RNA, designated SEQ ID NO: 6587, and a schematic representation of a predicted secondary folding of GAM336978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336978 folded precursor RNA yielding a GAM336978 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336978 RNA, hereby incorporated herein.

GAM336978 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336978 target RNA, herein designated GAM TARGET RNA.

GAM336978 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336978 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336978 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336978 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336978 RNA, herein designated GAM RNA, to target binding sites on GAM336978 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336978 target RNA into GAM336978 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336978 target gene, herein designated GAM TARGET GENE,

in fact represents a plurality of GAM336978 target genes. The mRNA of each one of this plurality of GAM336978 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336978 RNA, herein designated GAM RNA, and which when bound by GAM336978 RNA causes inhibition of translation of the GAM336978 target mRNA into a corresponding GAM336978 target protein.

The mechanism of the translational inhibition exerted by GAM336978 RNA, herein designated GAM RNA, on one or more GAM336978 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336978 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336978 RNA, herein designated GAM RNA, of GAM336978 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336978 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336978 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336978 RNA correlate with, and may be deduced from, the identity of the GAM336978 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336979 5949 ATAAGCTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGAATTCACA Messenger 336979 (GAM336979) oligonucleotides modulates expression of respective target
TGTGGTTGTA genes whose function and utility is known in the art.

TGCAGCTTTA GAM336979 is a novel bioinformatically detectable regulatory, non protein
CTGGGAGACT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336979 was detected
GAAGTGTATC is described with additional reference to Figs. 9-15.

TGCATGTGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTGCTGTGA encoded by the human genome.

TGGACACTTG GAM336979 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TAAGTTTGT GAM336979 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336979 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336979 precursor RNA is designated SEQ ID:5949, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5949 is located from position 62875341 to position 62875449 relative to chromosome 9 on the `-` strand.

GAM336979 precursor RNA folds onto itself, forming GAM336979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336979 precursor RNA, designated SEQ ID NO: 5949, and a schematic representation of a predicted secondary folding of GAM336979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336979 folded precursor RNA yielding a GAM336979 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336979 RNA, hereby incorporated herein.

GAM336979 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336979 target RNA, herein designated GAM TARGET RNA.

GAM336979 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336979 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336979 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336979 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336979 RNA, herein designated GAM RNA, to target binding sites on GAM336979 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336979 target RNA into GAM336979 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336979 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336979 target genes. The mRNA of each one of this plurality of GAM336979 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336979 RNA, herein designated GAM RNA, and which when bound by GAM336979 RNA causes inhibition of translation of the GAM336979 target mRNA into a corresponding GAM336979 target protein.

The mechanism of the translational inhibition exerted by GAM336979 RNA, herein designated GAM RNA, on one or more GAM336979 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336979 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336979 RNA, herein designated GAM RNA, of GAM336979 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336979 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336979 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336979 RNA correlate with, and may be deduced from, the identity of the GAM336979 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336980 6301 GAATAAATAA Fig. 8 further provides a conceptual description of another novel bioinformatically

TGCATGTGAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
TCTGCTGTGA encoded by the human genome.

TGGACACTTG GAM336981 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a
T GAM336981 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336981 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336981 precursor RNA is designated SEQ ID:5947, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5947 is located from position 62875349 to position 62875449 relative to chromosome 9 on the `-` strand.

GAM336981 precursor RNA folds onto itself, forming GAM336981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336981 precursor RNA, designated SEQ ID NO: 5947, and a schematic representation of a predicted secondary folding of GAM336981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336981 folded precursor RNA yielding a GAM336981 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336981 RNA, hereby incorporated herein.

GAM336981 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336981 target RNA, herein designated GAM TARGET RNA.

GAM336981 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336981 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336981 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336981 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336981 RNA, herein designated GAM RNA, to target binding sites on GAM336981 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336981 target RNA into GAM336981 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336981 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336981 target genes. The mRNA of each one of this plurality of GAM336981 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336981 RNA, herein designated GAM RNA, and which when bound by GAM336981 RNA causes inhibition of translation of the GAM336981 target mRNA into a corresponding GAM336981 target protein.

The mechanism of the translational inhibition exerted by GAM336981 RNA, herein designated GAM RNA, on one or more GAM336981 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336981 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336981 RNA, herein designated GAM RNA, of GAM336981 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336981 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336981 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336981 RNA correlate with, and may be deduced from, the identity of the GAM336981 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336983 6933 GTGTTTGGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
TAGAGCCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
TCTGAAATTA Messenger 336983 (GAM336983) oligonucleotides modulates expression of respective target
TAAGCACTGG genes whose function and utility is known in the art.

GGTACTCCTA GAM336983 is a novel bioinformatically detectable regulatory, non protein
TGTGTCTGGG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336983 was detected
ACTCTATGCC is described with additional reference to Figs. 9-15.

AAGTAT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336983 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336983 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336983 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336983 precursor RNA is designated SEQ ID:6933, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6933 is located from position 62901709 to position 62901784 relative to chromosome 11 on the `+` strand.

GAM336983 precursor RNA folds onto itself, forming GAM336983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336983 precursor RNA, designated SEQ ID NO: 6933, and a schematic representation of a predicted secondary folding of GAM336983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336983 folded precursor RNA yielding a GAM336983 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336983 RNA, hereby incorporated herein.

GAM336983 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336983 target RNA, herein designated GAM TARGET RNA.

GAM336983 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336983 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336983 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336983 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336983 RNA, herein designated GAM RNA, to target binding sites on GAM336983 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336983 target RNA into GAM336983 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336983 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336983 target genes. The mRNA of each one of this plurality of GAM336983 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336983 RNA, herein designated GAM RNA, and which when bound by GAM336983 RNA causes inhibition of translation of the GAM336983 target mRNA into a corresponding GAM336983 target protein.

The mechanism of the translational inhibition exerted by GAM336983 RNA, herein designated GAM RNA, on one or more GAM336983 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336983 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336983 RNA, herein designated GAM RNA, of GAM336983 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336983 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336983 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336983 RNA correlate with, and may be deduced from, the identity of the GAM336983 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336984 6045 CCAAGTAGAA Fig. 8 further provides a conceptual description of another novel bioinformatically
GCAAACTGTA detected oligonucleotides of the present invention, referred to here as Genomic Address
GTTTGATGCT Messenger 336984 (GAM336984) oligonucleotides modulates expression of respective target
AGAACACTAT genes whose function and utility is known in the art.

TCTTTGAGAG GAM336984 is a novel bioinformatically detectable regulatory, non protein
GGTATGTGTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336984 was detected
ATACTCGAAA is described with additional reference to Figs. 9-15.

TGCAGTCATG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
GCTCACGGCT encoded by the human genome.

TGG GAM336984 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336984 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336984 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336984 precursor RNA is designated SEQ ID:6045, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6045 is located from position 62916210 to position 62916302 relative to chromosome 14 on the `+` strand.

GAM336984 precursor RNA folds onto itself, forming GAM336984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336984 precursor RNA, designated SEQ ID NO: 6045, and a schematic representation of a predicted secondary folding of GAM336984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336984 folded precursor RNA yielding a GAM336984 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336984 RNA, hereby incorporated herein.

GAM336984 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336984 target RNA, herein designated GAM TARGET RNA.

GAM336984 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336984 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336984 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336984 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336984 RNA, herein designated GAM RNA, to target binding sites on GAM336984 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336984 target RNA into GAM336984 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336984 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336984 target genes. The mRNA of each one of this plurality of GAM336984 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336984 RNA, herein designated GAM RNA, and which when bound by GAM336984 RNA causes inhibition of translation of the GAM336984 target mRNA into a corresponding GAM336984 target protein.

The mechanism of the translational inhibition exerted by GAM336984 RNA, herein designated GAM RNA, on one or more GAM336984 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336984 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336984 RNA, herein designated GAM RNA, of GAM336984 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336984 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336984 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336984 RNA correlate with, and may be deduced from, the identity of the GAM336984 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336989 6004 CACTGCCAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GGGCTCAGGA Messenger 336989 (GAM336989) oligonucleotides modulates expression of respective target

GAGTCTTCGC genes whose function and utility is known in the art.

CTCTTGTACC GAM336989 is a novel bioinformatically detectable regulatory, non protein

CTCCTTGGGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336989 was detected

CTCTCCAAAA is described with additional reference to Figs. 9-15.

CCAGTG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM336989 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336989 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336989 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336989 precursor RNA is designated SEQ ID:6004, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6004 is located from position 63216696 to position 63216771 relative to chromosome 19 on the `-` strand.

GAM336989 precursor RNA folds onto itself, forming GAM336989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336989 precursor RNA, designated SEQ ID NO: 6004, and a schematic representation of a predicted secondary folding of GAM336989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336989 folded precursor RNA yielding a GAM336989 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336989 RNA, hereby incorporated herein.

GAM336989 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336989 target RNA, herein designated GAM TARGET RNA.

GAM336989 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336989 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336989 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336989 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336989 RNA, herein designated GAM RNA, to target binding sites on GAM336989 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336989 target RNA into GAM336989 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336989 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336989 target genes. The mRNA of each one of this plurality of GAM336989 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336989 RNA, herein designated GAM RNA, and which when bound by GAM336989 RNA causes inhibition of translation of the GAM336989 target mRNA into a corresponding GAM336989 target protein.

The mechanism of the translational inhibition exerted by GAM336989 RNA, herein designated GAM RNA, on one or more GAM336989 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336989 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336989 RNA, herein designated GAM RNA, of GAM336989 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336989 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336989 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336989 RNA correlate with, and may be deduced from, the identity of the GAM336989 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336990 6269 CTTGGCTGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TTTTTCCACG detected oligonucleotides of the present invention, referred to here as Genomic Address

TGAGATGGTG Messenger 336990 (GAM336990) oligonucleotides modulates expression of respective target

TCATATTGCT genes whose function and utility is known in the art.

GGGTCCAGCA GAM336990 is a novel bioinformatically detectable regulatory, non protein

CCCAGTTATT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336990 was detected

GTGGCCCAAT is described with additional reference to Figs. 9-15.

TTCCTATACC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CTGCCTAG encoded by the human genome.

GAM336990 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336990 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336990 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336990 precursor RNA is designated SEQ ID:6269, and is provided hereinbelow with reference to the sequence listing part.

Nucleotide sequence SEQ ID:6269 is located from position 63236493 to position 63236580 relative to chromosome 7 on the `+` strand.

GAM336990 precursor RNA folds onto itself, forming GAM336990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336990 precursor RNA, designated SEQ ID NO: 6269, and a schematic representation of a predicted secondary folding of GAM336990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336990 folded precursor RNA yielding a GAM336990 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336990 RNA, hereby incorporated herein.

GAM336990 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336990 target RNA, herein designated GAM TARGET RNA.

GAM336990 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336990 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336990 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336990 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336990 RNA, herein designated GAM RNA, to target binding sites on GAM336990 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336990 target RNA into GAM336990 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336990 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336990 target genes. The mRNA of each one of this plurality of GAM336990 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336990 RNA, herein designated GAM RNA, and which when bound by GAM336990 RNA causes inhibition of translation of the GAM336990 target mRNA into a corresponding GAM336990 target protein.

The mechanism of the translational inhibition exerted by GAM336990 RNA, herein designated GAM RNA, on one or more GAM336990 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336990 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336990 RNA, herein designated GAM RNA, of GAM336990 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336990 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336990 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336990 RNA correlate with, and may be deduced from, the identity of the GAM336990 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 336991 (GAM336991) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM336991 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336991 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM336991 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336991 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336991 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336991 precursor RNA is designated SEQ ID:5880, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5880 is located from position 63263870 to position 63263951 relative to chromosome 11 on the `+` strand.

GAM336991 precursor RNA folds onto itself, forming GAM336991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336991 precursor RNA, designated SEQ ID NO: 5880, and a schematic representation of a predicted secondary folding of GAM336991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336991 folded precursor RNA yielding a GAM336991 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336991 RNA, hereby incorporated herein.

GAM336991 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336991 target RNA, herein designated GAM TARGET RNA.

GAM336991 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336991 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336991 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336991 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336991 RNA, herein designated GAM RNA, to target binding sites on GAM336991 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336991 target RNA into GAM336991 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336991 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336991 target genes. The mRNA of each one of this plurality of GAM336991 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336991 RNA, herein designated GAM RNA, and which when bound by GAM336991 RNA causes inhibition of translation of the GAM336991 target mRNA into a corresponding GAM336991 target protein.

The mechanism of the translational inhibition exerted by GAM336991 RNA, herein designated GAM RNA, on one or more GAM336991 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336991 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336991 RNA, herein designated GAM RNA, of GAM336991 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336991 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336991 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336991 RNA correlate with, and may be deduced from, the identity of the GAM336991 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336992 7266 TGTCTATAGA Fig. 8 further provides a conceptual description of another novel bioinformatically

GTATGTGGGC detected oligonucleotides of the present invention, referred to here as Genomic Address

CATTTTCTGC Messenger 336992 (GAM336992) oligonucleotides modulates expression of respective target

CCGTAAAATG genes whose function and utility is known in the art.

TTCAAATGTT GAM336992 is a novel bioinformatically detectable regulatory, non protein

TTCTCTCTCT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336992 was detected

AAAGCTTTGT is described with additional reference to Figs. 9-15.

TCATTGTATC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TGGTGGAATT encoded by the human genome.

TTGGTTCTCA GAM336992 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GGGAGTAGAC GAM336992 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

A GAM336992 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336992 precursor RNA is designated SEQ ID:7266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7266 is located from position 63315058 to position 63315168 relative to chromosome 17 on the `-` strand.

GAM336992 precursor RNA folds onto itself, forming GAM336992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336992 precursor RNA, designated SEQ ID NO: 7266, and a schematic representation of a predicted secondary folding of GAM336992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336992 folded precursor RNA yielding a GAM336992 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides two possible nucleotide sequences of GAM336992 RNA: a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336992 RNA and an alternative nucleotide sequence thereof, hereby incorporated herein.

GAM336992 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336992 target RNA, herein designated GAM TARGET RNA.

GAM336992 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336992 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336992 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336992 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336992 RNA, herein designated GAM RNA, to target binding sites on GAM336992 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336992 target RNA into GAM336992 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336992 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336992 target genes. The mRNA of each one of this plurality of GAM336992 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336992 RNA, herein designated GAM RNA, and which when bound by GAM336992 RNA causes inhibition of translation of the GAM336992 target mRNA into a corresponding GAM336992 target protein.

The mechanism of the translational inhibition exerted by GAM336992 RNA, herein designated GAM RNA, on one or more GAM336992 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336992 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336992 RNA, herein designated GAM RNA, of GAM336992 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336992 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336992 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336992 RNA correlate with, and may be deduced from, the identity of the GAM336992 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336995 6627 GGAGAATCGC Fig. 8 further provides a conceptual description of another novel bioinformatically
TTGAACCCAG detected oligonucleotides of the present invention, referred to here as Genomic Address
GAAGTGGAGG Messenger 336995 (GAM336995) oligonucleotides modulates expression of respective target
TTGCAGTGAG genes whose function and utility is known in the art.

CCAATATTGT GAM336995 is a novel bioinformatically detectable regulatory, non protein
GCCATTGCAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336995 was detected
TCCAGCTTGG is described with additional reference to Figs. 9-15.

GCAACAAGAG GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CGAAACTCC encoded by the human genome.

GAM336995 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336995 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336995 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336995 precursor RNA is designated SEQ ID:6627, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6627 is located from position 63490699 to position 63490787 relative to chromosome 19 on the `+` strand.

GAM336995 precursor RNA folds onto itself, forming GAM336995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336995 precursor RNA, designated SEQ ID NO: 6627, and a schematic representation of a predicted secondary folding of GAM336995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336995 folded precursor RNA yielding a GAM336995 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336995 RNA, hereby incorporated herein.

GAM336995 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336995 target RNA, herein designated GAM TARGET RNA.

GAM336995 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336995 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336995 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336995 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336995 RNA, herein designated GAM RNA, to target binding sites on GAM336995 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336995 target RNA into GAM336995 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336995 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336995 target genes. The mRNA of each one of this plurality of GAM336995 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336995 RNA, herein designated GAM RNA, and which when bound by GAM336995 RNA causes inhibition of translation of the GAM336995 target mRNA into a corresponding GAM336995 target protein.

The mechanism of the translational inhibition exerted by GAM336995 RNA, herein designated GAM RNA, on one or more GAM336995 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336995 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336995 RNA, herein designated GAM RNA, of GAM336995 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336995 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336995 RNA, herein designated GAM RNA, are set forth in Tables

6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336995 RNA correlate with, and may be deduced from, the identity of the GAM336995 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM336996 7049 TCGCTTGAAC Fig. 8 further provides a conceptual description of another novel bioinformatically

GAGGTTGCAG Messenger 336996 (GAM336996) oligonucleotides modulates expression of respective target
TGAGCCAATA genes whose function and utility is known in the art.

TTGTGCCATT GAM336996 is a novel bioinformatically detectable regulatory, non protein
GCACTCCAGC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336996 was detected
TTGGGCAACA is described with additional reference to Figs. 9-15.

AGAGCGA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336996 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336996 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM336996 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336996 precursor RNA is designated SEQ ID:7049, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7049 is located from position 63490705 to position 63490781 relative to chromosome 19 on the `+` strand.

GAM336996 precursor RNA folds onto itself, forming GAM336996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336996 precursor RNA, designated SEQ ID NO: 7049, and a schematic representation of a predicted secondary folding of GAM336996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336996 folded precursor RNA yielding a GAM336996 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336996 RNA, hereby incorporated herein.

GAM336996 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336996 target RNA, herein designated GAM TARGET RNA.

GAM336996 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336996 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336996 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336996 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336996 RNA, herein designated GAM RNA, to target binding sites on GAM336996 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336996 target RNA into GAM336996 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336996 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336996 target genes. The mRNA of each one of this plurality of GAM336996 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336996 RNA, herein designated GAM RNA, and which when bound by GAM336996 RNA causes inhibition of translation of the GAM336996 target mRNA into a corresponding GAM336996 target protein.

The mechanism of the translational inhibition exerted by GAM336996 RNA, herein designated GAM RNA, on one or more GAM336996 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336996 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM336996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336996 RNA, herein designated GAM RNA, of GAM336996 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336996 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336996 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336996 RNA correlate with, and may be deduced from, the identity of the GAM336996 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

TAGGCCCATT GAM336997 is a novel bioinformatically detectable regulatory, non protein
AATAGTGTAC coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM336997 was detected
ATGTGACAGC is described with additional reference to Figs. 9-15.

CT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
encoded by the human genome.

GAM336997 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM336997 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes
GAM336997 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336997 precursor RNA is designated SEQ ID:5773, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5773 is located from position 63567534 to position 63567605 relative to chromosome 20 on the `+` strand.

GAM336997 precursor RNA folds onto itself, forming GAM336997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM336997 precursor RNA, designated SEQ ID NO: 5773, and a schematic representation of a predicted secondary folding of GAM336997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4

incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM336997 folded precursor RNA yielding a GAM336997 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM336997 RNA, hereby incorporated herein.

GAM336997 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336997 target RNA, herein designated GAM TARGET RNA.

GAM336997 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM336997 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336997 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336997 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM336997 RNA, herein designated GAM RNA, to target binding sites on GAM336997 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336997 target RNA into GAM336997 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM336997 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336997 target genes. The mRNA of each one of this plurality of GAM336997 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336997 RNA, herein designated GAM RNA, and which when bound by GAM336997 RNA causes inhibition of translation of the GAM336997 target mRNA into a corresponding GAM336997 target protein.

The mechanism of the translational inhibition exerted by GAM336997 RNA, herein designated GAM RNA, on one or more GAM336997 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM336997 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic

representation of a predicted secondary folding of GAM336997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM336997 RNA, herein designated GAM RNA, of GAM336997 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM336997 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM336997 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM336997 RNA correlate with, and may be deduced from, the identity of the GAM336997 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GTATGCCACA encoded by the human genome.

TAATGACATT GAM337000 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

TCAGTCAGTG GAM337000 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GT GAM337000 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337000 precursor RNA is designated SEQ ID:5702, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5702 is located from position 63919661 to position 63919772 relative to chromosome 12 on the `+` strand.

GAM337000 precursor RNA folds onto itself, forming GAM337000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337000 precursor RNA, designated SEQ ID NO: 5702, and a schematic representation of a predicted secondary folding of GAM337000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337000 folded precursor RNA yielding a GAM337000 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337000 RNA, hereby incorporated herein.

GAM337000 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337000 target RNA, herein designated GAM TARGET RNA.

GAM337000 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337000 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337000 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337000 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337000 RNA, herein designated GAM RNA, to target binding sites on GAM337000 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337000 target RNA into GAM337000 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337000 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337000 target genes. The mRNA of each one of this plurality of GAM337000 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337000 RNA, herein designated GAM RNA, and which when bound by GAM337000 RNA causes inhibition of translation of the GAM337000 target mRNA into a corresponding GAM337000 target protein.

The mechanism of the translational inhibition exerted by GAM337000 RNA, herein designated GAM RNA, on one or more GAM337000 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337000 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337000 RNA, herein designated GAM RNA, of GAM337000 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337000 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337000 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337000 RNA correlate with, and may be deduced from, the identity of the GAM337000 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337001 6115 CCTGAACCCA Fig. 8 further provides a conceptual description of another novel bioinformatically

GGAGGCGGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGCAGTGG Messenger 337001 (GAM337001) oligonucleotides modulates expression of respective target

GCCAAGATTA genes whose function and utility is known in the art.

AGCCACTGCA GAM337001 is a novel bioinformatically detectable regulatory, non protein

CTCCAGCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337001 was detected

GGCAACAGG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

encoded by the human genome.

GAM337001 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337001 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337001 precursor RNA does not encode a protein. A nucleotide sequence identical or

highly similar to the nucleotide sequence of GAM337001 precursor RNA is designated SEQ ID:6115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6115 is located from position 63948506 to position 63948574 relative to chromosome 17 on the `+` strand.

GAM337001 precursor RNA folds onto itself, forming GAM337001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337001 precursor RNA, designated SEQ ID NO: 6115, and a schematic representation of a predicted secondary folding of GAM337001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337001 folded precursor RNA yielding a GAM337001 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337001 RNA, hereby incorporated herein. Expression of GAM337001 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337001 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337001 target RNA, herein designated GAM TARGET RNA.

GAM337001 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337001 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337001 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337001 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337001 RNA, herein designated GAM RNA, to target binding sites on GAM337001 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337001 target RNA into GAM337001 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337001 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337001 target genes. The mRNA of each one of this plurality of GAM337001 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337001 RNA, herein designated GAM RNA, and which when bound by GAM337001 RNA causes inhibition of translation of the GAM337001 target mRNA into a corresponding GAM337001 target protein.

The mechanism of the translational inhibition exerted by GAM337001 RNA, herein designated GAM RNA, on one or more GAM337001 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337001 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337001 RNA, herein designated GAM RNA, of GAM337001 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337001 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337001 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337001 RNA correlate with, and may be deduced from, the identity of the GAM337001 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337003 6262 CTTGAACCTG Fig. 8 further provides a conceptual description of another novel bioinformatically

AAAGGCAGAG detected oligonucleotides of the present invention, referred to here as Genomic Address

GCTGCGGTGA Messenger 337003 (GAM337003) oligonucleotides modulates expression of respective target

GCTGAGATTG genes whose function and utility is known in the art.

CGCCATTGCA GAM337003 is a novel bioinformatically detectable regulatory, non protein

CTCCAGCCTG coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337003 was detected

GGCAACAAG is described with additional reference to Figs. 9-15.

GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene encoded by the human genome.

GAM337003 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337003 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes GAM337003 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337003 precursor RNA is designated SEQ ID:6262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6262 is located from position 64886976 to position 64887044 relative to chromosome 7 on the `-` strand.

GAM337003 precursor RNA folds onto itself, forming GAM337003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337003 precursor RNA, designated SEQ ID NO: 6262, and a schematic representation of a predicted secondary folding of GAM337003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337003 folded precursor RNA yielding a GAM337003 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337003 RNA, hereby incorporated herein. Expression of GAM337003 RNA was experimentally validated in HeLa cells using the methods described with reference to Figs.22 to 24.

GAM337003 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337003 target RNA, herein designated GAM TARGET RNA.

GAM337003 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337003 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337003 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337003 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING

SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337003 RNA, herein designated GAM RNA, to target binding sites on GAM337003 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337003 target RNA into GAM337003 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337003 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337003 target genes. The mRNA of each one of this plurality of GAM337003 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337003 RNA, herein designated GAM RNA, and which when bound by GAM337003 RNA causes inhibition of translation of the GAM337003 target mRNA into a corresponding GAM337003 target protein.

The mechanism of the translational inhibition exerted by GAM337003 RNA, herein designated GAM RNA, on one or more GAM337003 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337003 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337003 RNA, herein designated GAM RNA, of GAM337003 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set

forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337003 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337003 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337003 RNA correlate with, and may be deduced from, the identity of the GAM337003 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337004 6145 CGGGGATTCA Fig. 8 further provides a conceptual description of another novel bioinformatically

TCTTTCCCTT is described with additional reference to Figs. 9-15.

CTTTCTTCTT GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CACCCAATAA encoded by the human genome.

ACCCTG GAM337004 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

GAM337004 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337004 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337004 precursor RNA is designated SEQ ID:6145, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6145 is located from position 65016569 to position 65016664 relative to chromosome 17 on the `+` strand.

GAM337004 precursor RNA folds onto itself, forming GAM337004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337004 precursor RNA, designated SEQ ID NO: 6145, and a schematic representation of a predicted secondary folding of GAM337004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337004 folded precursor RNA yielding a GAM337004 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337004 RNA, hereby incorporated herein.

GAM337004 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337004 target RNA, herein designated GAM TARGET RNA.

GAM337004 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region,

designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337004 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337004 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337004 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337004 RNA, herein designated GAM RNA, to target binding sites on GAM337004 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337004 target RNA into GAM337004 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337004 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337004 target genes. The mRNA of each one of this plurality of GAM337004 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337004 RNA, herein designated GAM RNA, and which when bound by GAM337004 RNA causes inhibition of translation of the GAM337004 target mRNA into a corresponding GAM337004 target protein.

The mechanism of the translational inhibition exerted by GAM337004 RNA, herein designated GAM RNA, on one or more GAM337004 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337004 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337004 RNA, herein designated GAM RNA, of GAM337004 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337004 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337004 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

GAACAGGAGA is described with additional reference to Figs. 9-15.

AATGGAGGAC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTCTGTGGGA encoded by the human genome.

GTGTGGAGAC GAM337008 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a

AGTGAG GAM337008 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337008 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337008 precursor RNA is designated SEQ ID:6163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6163 is located from position 65050472 to position 65050577 relative to chromosome 9 on the `+` strand.

GAM337008 precursor RNA folds onto itself, forming GAM337008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337008 precursor RNA, designated SEQ ID NO: 6163, and a schematic representation of a predicted secondary folding of GAM337008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337008 folded precursor RNA yielding a GAM337008 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337008 RNA, hereby incorporated herein.

GAM337008 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337008 target RNA, herein designated GAM TARGET RNA.

GAM337008 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337008 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337008 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337008 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337008 RNA, herein designated GAM RNA, to target binding sites on GAM337008 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337008 target RNA into GAM337008 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337008 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337008 target genes. The mRNA of each one of this plurality of GAM337008 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337008 RNA, herein designated GAM RNA, and which when bound by GAM337008 RNA causes inhibition of translation of the GAM337008 target mRNA into a corresponding GAM337008 target protein.

The mechanism of the translational inhibition exerted by GAM337008 RNA, herein designated GAM RNA, on one or more GAM337008 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337008 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337008 RNA, herein designated GAM RNA, of GAM337008 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337008 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337008 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337008 RNA correlate with, and may be deduced from, the identity of the GAM337008 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337009 5881 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337009 (GAM337009) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337009 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337009 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337009 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337009 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337009 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337009 precursor RNA is designated SEQ ID:5881, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5881 is located from position 65068010 to position 65068091 relative to chromosome 8 on the `+` strand.

GAM337009 precursor RNA folds onto itself, forming GAM337009 folded precursor

RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337009 precursor RNA, designated SEQ ID NO: 5881, and a schematic representation of a predicted secondary folding of GAM337009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337009 folded precursor RNA yielding a GAM337009 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337009 RNA, hereby incorporated herein.

GAM337009 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337009 target RNA, herein designated GAM TARGET RNA.

GAM337009 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337009 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337009 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337009 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337009 RNA, herein designated GAM RNA, to target binding sites on GAM337009 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337009 target RNA into GAM337009 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337009 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337009 target genes. The mRNA of each one of this plurality of GAM337009 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337009 RNA,

herein designated GAM RNA, and which when bound by GAM337009 RNA causes inhibition of translation of the GAM337009 target mRNA into a corresponding GAM337009 target protein.

The mechanism of the translational inhibition exerted by GAM337009 RNA, herein designated GAM RNA, on one or more GAM337009 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337009 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337009 RNA, herein designated GAM RNA, of GAM337009 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337009 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337009 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337009 RNA correlate with, and may be deduced from, the identity of the GAM337009 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337010 5882 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337010 (GAM337010) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337010 is a novel bioinformatically detectable regulatory, non protein

TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337010 was detected

TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

CT encoded by the human genome.

GAM337010 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337010 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337010 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337010 precursor RNA is designated SEQ ID:5882, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5882 is located from position 65112308 to position 65112389 relative to chromosome X on the `+` strand.

GAM337010 precursor RNA folds onto itself, forming GAM337010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337010 precursor RNA, designated SEQ ID NO: 5882, and a schematic representation of a predicted secondary folding of GAM337010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337010 folded precursor RNA yielding a GAM337010 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337010 RNA, hereby incorporated herein.

GAM337010 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337010 target RNA, herein designated GAM TARGET RNA.

GAM337010 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337010 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337010 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337010 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337010 RNA, herein designated GAM RNA, to target binding sites on GAM337010 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337010 target RNA

into GAM337010 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337010 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337010 target genes. The mRNA of each one of this plurality of GAM337010 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337010 RNA, herein designated GAM RNA, and which when bound by GAM337010 RNA causes inhibition of translation of the GAM337010 target mRNA into a corresponding GAM337010 target protein.

The mechanism of the translational inhibition exerted by GAM337010 RNA, herein designated GAM RNA, on one or more GAM337010 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337010 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337010 RNA, herein designated GAM RNA, of GAM337010 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337010 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337010 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337010 RNA correlate with, and may be deduced from, the identity of the GAM337010 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337011 6481 GCAAGGTGCT Fig. 8 further provides a conceptual description of another novel bioinformatically

AGGTTTTTTC detected oligonucleotides of the present invention, referred to here as Genomic Address

CTTTCCCCAC Messenger 337011 (GAM337011) oligonucleotides modulates expression of respective target

CTGTCTCTTA genes whose function and utility is known in the art.

GCCTGGGGAA GAM337011 is a novel bioinformatically detectable regulatory, non protein

TTAAATGAGA coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337011 was detected

AGCCTTAGAA is described with additional reference to Figs. 9-15.

TGGGTGGCCC GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene

TTGT encoded by the human genome.

GAM337011 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337011 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337011 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337011 precursor RNA is designated SEQ ID:6481, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6481 is located from position 65182638 to position 65182721 relative to chromosome X on the `+` strand.

GAM337011 precursor RNA folds onto itself, forming GAM337011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337011 precursor RNA, designated SEQ ID NO: 6481, and a schematic representation of a predicted secondary folding of GAM337011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337011 folded precursor RNA yielding a GAM337011 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337011 RNA, hereby incorporated herein.

GAM337011 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337011 target RNA, herein designated GAM TARGET RNA.

GAM337011 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337011 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337011 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337011 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in

the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337011 RNA, herein designated GAM RNA, to target binding sites on GAM337011 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337011 target RNA into GAM337011 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.

It is appreciated that GAM337011 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337011 target genes. The mRNA of each one of this plurality of GAM337011 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337011 RNA, herein designated GAM RNA, and which when bound by GAM337011 RNA causes inhibition of translation of the GAM337011 target mRNA into a corresponding GAM337011 target protein.

The mechanism of the translational inhibition exerted by GAM337011 RNA, herein designated GAM RNA, on one or more GAM337011 target genes, herein collectively designated GAM TARGET GENE, may be similar or identical to the known mechanism of translational inhibition exerted byknown miRNA genes.

Nucleotide sequence of GAM337011 precursor RNA, herein designated GAM PRECURSOR RNA, , their respective genomic sources and chromosomal locations and a schematic representation of a predicted secondary folding of GAM337011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4, incorporated herein.

Nucleotide sequences of a `diced` GAM337011 RNA, herein designated GAM RNA, of GAM337011 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth

in Table 5, incorporated herein

Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on GAM337011 target RNA, herein designated GAM TARGET RNA, and a schematic representation of the complementarity of each of these target binding sites to GAM337011 RNA, herein designated GAM RNA, are set forth in Tables 6 and 7, incorporated herein.

It is appreciated that specific functions, and accordingly utilities, of GAM337011 RNA correlate with, and may be deduced from, the identity of the GAM337011 target gene inhibited thereby, whose functions are set forth in Table 8, incorporated herein.

GAM337013 5883 AGTTTTAGGG Fig. 8 further provides a conceptual description of another novel bioinformatically

TACATGTGCA detected oligonucleotides of the present invention, referred to here as Genomic Address

CAACATGCAG Messenger 337013 (GAM337013) oligonucleotides modulates expression of respective target

GTTTGTTACA genes whose function and utility is known in the art.

TATGTATACA GAM337013 is a novel bioinformatically detectable regulatory, non protein
TGTGCCATGT coding, micro RNA (miRNA)-like oligonucleotide. The method by which GAM337013 was detected
TGGTGTGCTG is described with additional reference to Figs. 9-15.

CACCCATTAA GAM PRECURSOR DNA is encoded by the human genome. GAM TARGET GENE is a humen gene
CT encoded by the human genome.

GAM337013 precursor DNA, herein designated GAM PRECURSOR DNA, encodes a GAM337013 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes

GAM337013 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337013 precursor RNA is designated SEQ ID:5883, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5883 is located from position 65319486 to position 65319567 relative to chromosome 15 on the `+` strand.

GAM337013 precursor RNA folds onto itself, forming GAM337013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is a fully or partially complementary sequence of the nucleotide sequence of the second half thereof.

Nucleotide sequence of GAM337013 precursor RNA, designated SEQ ID NO: 5883, and a schematic representation of a predicted secondary folding of GAM337013 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, are set forth in Tables 3 and 4 incorporated herein.

An enzyme complex designated DICER COMPLEX, `dices` the GAM337013 folded precursor RNA yielding a GAM337013 RNA, herein designated GAM RNA, in the form of a single stranded ~22nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product to yield a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer RNase III together with other necessary proteins. Table 5 provides a nucleotide sequence that is highly likely to be identical or highly similar to the nucleotide sequence of GAM337013 RNA, hereby incorporated herein.

GAM337013 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337013 target RNA, herein designated GAM TARGET RNA.

GAM337013 target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

GAM337013 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337013 target RNA, herein

designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337013 RNA is a partial or fully complementary sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows three such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is only illustrative and that any suitable number of target binding sites may be present. It is further appreciated that although Fig. 8 shows target binding sites only in the 3`UTR region, these target binding sites may be located instead in the 5`UTR region or in both 3`UTR and 5`UTR regions

The complementary binding of GAM337013 RNA, herein designated GAM RNA, to target binding sites on GAM337013 target RNA, herein designated GAM TARGET RNA, such as BINDING

SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337013 target RNA into GAM337013 target protein, herein designated GAM TARGET PROTEIN,, which is shown surrounded by a broken line.
